1. *Ordinary Language*:

1. A name, a title, a designation.

"There wanteth a term or *nomenclature* for it."—*Bacon Natural Hist.* 9.

2. A vocabulary, a dictionary, a glossary.

II. *Science*: The names taken collectively of the objects of study in any branch of science. Sometimes it includes, but more generally it is distinguished from, terminology. In botany, for example, the names assigned to the several classes, orders, tribes, genera, species, &c., are its nomenclature; the definition of the various words, whether substantives or adjectives, used in describing a plant, belong to terminology. The designation, *Rosa canina* (Dog-rose), falls under the department of nomenclature; nectary, diuretic, &c., under that of terminology. In 1842 the subject of scientific nomenclature was investigated and reported on by a Committee of the British Association.

1. *Rid.*: The practice of using two names — one generic, the other specific; it originated with Linnæus. [2. 6.]

2. *Bot.*: Linnæus laid down thirty-one rules for the guidance of botanists in nomenclature; some of these have fallen into disuse. [§. 1.] Orders generally end in *-aceæ*, tribes in *-eæ*, and their sub-divisions in *-ideæ*. Botanical assemblages with the last-named ending are called, in this work, families; though family in botany is sometimes made synonymous with order. This brings them into harmony with zoological families in *-ideæ*, to which they are apparently equivalent.

3. *Chem.*: The spoken language of chemistry, which at every period of its history reflects the stage of its development. The early belief that the heavenly bodies determined the character of terrestrial matter led to the use of such names as *sol* = gold, *luna* = silver, and mercury, the name by which the metal is still known. Later, the physical character of the substance gave rise to the name of the compound, as in milk of lime, sugar of lead. But the present system is, with some minor variations, the work of Lavoisier, Berthollet, and Morveau, and appeared in 1787. The leading principle is that the names of compound bodies should express the simple substances they contain, and their relative proportions. Generally the root-word is employed, together with certain terminations and prefixes to indicate the degree of oxidation and the number of atoms of the elements contained in it—*e. g.* KNO_3 = potassium nitrate, KNO_2 = potassium nitrite, HNO_3 = nitric acid, HNO_2 = nitrous acid. The following compound shows the manner in which the numerical prefixes are employed.

H_2Cl_4
 H_4Cl_2
 O_2 = tetra-mer-

cyro-tetra-hydric-dioxi-dichloro-dinitride. The above rule does not apply strictly to organic substances, where regard is had to the history of the groups forming the compound.

4. *Geol.*: For the names given to the geological formations, as Silurian, Devonian, Oolite, &c. (see Geology). The system adopted has many merits, but in one direction it tends to generate error. When a stratum is called chalk, one naturally expects it to be white and calcareous; it may be neither the one nor the other. When another is called greensand, the mind expects it to be characterized by grains of sand of green colour, it may be quite different. Such words, used of the spots where the several strata were first identified, are appropriate; but, being founded on local peculiarities, become quite inapplicable when applied to other, and speci-

fäte, fät, fare, amidst, what, fäll, father; wē, wēt, hēre, camel, hēr, thère; pine, pit, sire, sir, marine; gö, pöt, or, wöre, wölf, work, who, sön; mute, cüb, cure, ünite, eur, rüle, füll; trÿ, Sÿrian. æ. œ = ē; ey = ä; qu = kw.

ally to distant regions. Used of the world at large, they are simply chronological, and have no reference to the appearance of particular rocks.

5. *Min., Petrol., & Palaeont.*: Linnæus carried his system of two Latin names through the mineral no less than the animal kingdom. Thus, he had his *Schistus talchensis*, *S. alpinus*, &c. These are now exchanged for the vernacular terms. Minerals are now generally made to end in -ite, which Dana alters for rocks to -ate. Genera of fossils often end in -ites, as Belemnites, anguished Belemnite.

6. *Zool.*: In the days of Swanson and the other adherents of the quinary system, conformity of system in the nomenclature was greatly insisted upon. Every tribe ended in -es, every family in -ida, and every sub-family in -inae. Of late, the system has been departed from, and the great aid which it rendered to the memory in consequence sacrificed. With regard to vernacular names, they vary in different parts of the country, and often suggest error. Thus the goat-sucker does not suck goats, and the titmouse is not one of the Murres, but a bird. They are regarded as unscientific, and used only for popular convenience in scientific works. [L.]

Hist. & Philos.: The name given to one of two rival schools of philosophy which flourished in the Middle Ages, though the origin of the dispute dates from the days of Plato. It turned on the real nature of genera and species, and the motto of nominalism was "Universalia post rem." Roscellinus, canon of Compiègne, in the latter part of the eleventh century, was the first advocate of Nominalism, and maintained, in opposition to the advocates of Realism, that general ideas have no separate entity. He was charged with holding heretical opinions concerning the Trinity, for which he was cited before the Council of Soissons, and condemned A.D. 1092. They were of two kinds: first, those who, being religious, worshipped nowhere, second, those who attended the services of some other religious denomination than the established church. It was more frequently used of the latter class. The name was first applied to those who declined to conform to the enactments of the Act of Uniformity, 2 & 3 Edward VI., c. 1, passed in 1549. It was revived and applied to the two thousand clergymen who had to surrender the livings on account of their inability to conform to the more celebrated Act of Uniformity, 14 Charles II., c. 4, first enforced on Aug. 24, 1662. Etymologically viewed, a Dissenter and a Nonconformist somewhat differ. The former word denotes that he feels differently from Churchmen, that his sympathies go in a different direction; the latter word refers, not to his feelings, but to his action with respect to public worship. Church Hist. (Pl.): A term applied to those of the clergy and laity of the Establishment, who, holding that James II. was sovereign *de jure* after the throne had been declared vacant, refused to take the oath of allegiance to William III. and his successors. Among these were Sancroft, Archbishop of Canterbury, and six bishops—Turner (Ely), Lloyd (Norwich), Frampton (Gloucester), Lake (Chester), White (Peterborough), and Ken (Bath and Wells). Sancroft sanctioned the consecration of a bishop, and thus a schism arose. The Nonjurors themselves divided on the question of Nonjurors' usages (q.v.), and each party consecrated bishops. Gordon, the last prelate of the regular body, died in 1799, and so the Nonjurors proper came to an end. "It is usual for a plaintiff, when he or she is found to perceive that he has not given evidence sufficient to maintain his issue, to be voluntarily *non-suited* (to withdraw himself); whereupon the clerk is ordered to call the plaintiff; and if he do not, or any body for him, appears, he is *non-suited*, the process is discharged, the action is at an end, and the defendant shames his costs. The reason of this practice is, that a *non-suit* is more eligible for the plaintiff, than a verdict against him; for after a *non-suit*, which is only a default, he may commence the same suit again at the same cause of action; but after a verdict and judgment, consequent thereon, he is for ever barred from attacking the defendant upon the same ground of complaint. Norman architecture, *s.*
Architecture:

1. *In France*: The Normans brought the Romanesque style to a high state of perfection in this country. Whilst the simplicity of the entire structure and the general effect bear witness to the Roman origin of the style, yet there is displayed a rich treatment of details. Both piers and arches are moulded, and the ornamentation, especially that which serves as a rich setting to the arches, consists of the most simple line patterns; as, for instance, the meander, or the zigzag, or of bands or fillets occurring in regular succession; frequently, also, it is composed of various enrichments resembling the squares of a chess-

board, lozenges, or rail-heads. Norman workmanship was, at first, remarkable only for its solidity. The walls were of great thickness, and often built of rubble, faced with small squared stones. A number of buildings which had been copied from the works which the Romans had left behind them in France.

2. *In England*: English Romanesque (more commonly called Norman) architecture is to be considered as a branch and offshoot of that of Normandy; for, while in the peculiarities of detail crop up, the main features of the original style are distinctly observed. The earliest work of the Normans which exists in this country was conducted by Gundulph, who, after rebuilding his cathedral at Rochester, was employed by William to superintend the construction of the White Tower, in the Tower of London, which contains within its walls perhaps the only unaltered remnant of the Conqueror's time at present in existence. Simplicity of design and detail is not met with in the same degree as in Normandy itself. Very richly moulded features are introduced into heavy masses of building, and more ornamentation is employed, which is introduced in an arbitrary manner. The plan of the churches was the same as in Normandy. All were built with the semicircular chancel, but the arches of the nave usually rested on heavy cylindrical piers, hardly ever to be found in French churches, except in crypts. The windows and the doors were the same as in Normandy, and the Norman mouldings were introduced with little alteration. The walls were remarkably thick, and without prominent buttresses. Specimens of the time of Rufus are to be seen in the west end and nave of Rochester cathedral; the choir, side aisles, and middle transept at Durham; in the walls of the lower part of the western facade of Lincoln; the tower and transept

of St. Alban's; and the oldest remaining parts of Winchester. A strongly-marked mode of enrichment, resembling scales or diamonds in its design, was generally employed on the surface of the walls; the arches were ornamented for the most part with the usual zigzag. The character of the exterior of buildings in the Norman style may be described as heavy and massive. The windows were generally small. Blind, narrow arcades often occur in the facades and towers, sometimes interlacing, and sometimes not so, in several ranges, one above the other. The Norman style is of frequent occurrence in the case of the castles of the feudal lords of the epoch. The nucleus of these buildings, which were in reality fortresses, consisted of a high and massive tower, which served at the same time to the residence of the lord and for purposes of defence. This tower was only accessible by a flight of steps leading along the wall to an upper storey of the building, and was only lighted by very small windows. In the last

quarter of the twelfth century the transition from the Norman to the Pointed or Early English style began. The earliest examples of this are the round part of the Temple Church, London, consecrated in 1185; the choir of Canterbury Cathedral, rebuilt after the fire, in 1175; and the great tower at the west end of Ely Cathedral, built by Bishop Ridel, who died in 1189. I. Ordinary Language:

1. Originally, among the ancient Romans, a person employed to take notes of trials, proceedings in courts, contracts, &c.; a shorthand writer. This kind of work was at first usually performed by slaves, but the notarii, as they increased in ability and raised themselves above the servile ranks, gradually assumed the duties and functions of the tabelliones, writers who, under the Roman law, were employed in drawing up contracts, wills and commercial documents, and the work which fell to them in this capacity corresponded very closely to some of the

business now undertaken by the modern notary public, the solicitor, attorney, and conveyancer.

2. A public official authorized to attest signatures in deeds, contracts, affidavits, declarations, and especially such as are to be sent to foreign countries. They note and protest bills of exchange, draw up protests after receiving the affidavits of mariners and masters of ships, and administer oaths. Frequently called a Notary Public.

"Go with me to a *notary*, seal me there." *You'll hoist!* *Shakespeare, Merchant of Venice*, i. 1.

3. From a document dated 1571, it appears that the Company of Notaries in London at that time numbered sixteen, and that they led their living by the "Making of Proches, Intimations, and Remissions, and other writings," for the doing of which a monopoly had just been granted to one Richard Candler. Bot.: Marked, variegated; having variegated spots or lines.

1. The act of marking or noting; the act or practice of recording anything by means of marks, characters, or figures.

2. A system of marks, notes, signs, or characters employed in any art or science, to express in a brief and compendious form certain facts connected with that art or science. [S.]

3. Etymology; etymological signification.

"The notation of a word is, when the original thereof is sought out; and consisteth in two things, the kind and the figure." *Ben Jonson: English Grammar*, ch. viii.

(1) *Architectural Notation:* A system of signs, marks, or characters, appended to figures, when used to denote dimensions on drawings, as "for feet," "for inches," "for parts; as, 10' 6" = ten feet six inches.

(2) *Arithmetical Notation:* A system of figures or characters used to represent numbers. Two methods of expressing numbers are at present in use, the Roman and the Arabic.

In the Roman method seven characters are employed, called numeral letters. These, standing separately, represent the following numbers, viz., I for one, V for five, X for ten, L for fifty, C for one hundred, D for five hundred, and M for one thousand. By combinations of these characters, in accordance with the following principles, every number may be expressed: (a) when a letter stands alone, it represents the number given above, as V for five; (b) when a letter is repeated, the combination stands for the product of the number denoted by the letter by the number of times which it is taken; thus, III, stands for three; XXX, for thirty, &c.; (c) when a letter precedes another, taken in the order given above, the combination stands for the number denoted by the greater diminished by that denoted by the less; thus, IV, stands for five less one, i.e., four; XC, for one hundred less ten, i.e., ninety, &c.; (d) when a letter, taken in the order given above, follows another, the combination stands for the sum of the numbers denoted by the letters taken separately; thus, XI, stands for ten plus one, i.e., eleven; LV, for fifty plus five, i.e., fifty-five; CIV, for one hundred plus four [IV = five less one, i.e., four as in (c)], i.e., one hundred and four; MDCCCLXXXV, for eighteen hundred and eighty-five. This method of notation is now little used except for dates, headings of chapters, &c.

In the Arabic, or rather the Hindoo, method, introduced by the Arabs into Europe at the close of the tenth century, numbers are represented by the symbols, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, and their combinations, according to conventional rules. The characters are called

figures or digits, and, taken in their order, stand for nought, one, two, three, four, five, six, seven, eight, nine; the value of the unit depends upon the place, which the figure occupies in the scale of digits. The value of each figure, or digit, increases as it is added into from the right, and is ten times the number of places of the digit to the left of the left unit; thus, the digit 4, in the number 40, and the digit itself the number 4, each power intended to be expressed, thus, 40 = 40, 400 = 400, 4000 = 4000, and so on.

(3) *Chemical Notation:* The method of representing elements of chemistry. The symbols now in use are exclusively to modern times, but in all ages signs of some kind or other have been employed to represent the various kinds of matter. In 1814 Berzelius expressed the idea of the initial letters of the elements, and the employment of exponents to express the number of the same atoms in the compound, by using chemical notation almost into its present state. Thus, sulphuric acid, Na₂SO₄, indicating that the compound is formed of two atoms of sodium (natrium), one of sulphur, and four of oxygen. In organic compounds, the constitution of which is known, the symbols are so arranged as to show the various groups of radicals. (C₁₀H₁₅O) = decylhe acetate, but laryric acid, with the same number of atoms, is expressed by (C₁₁H₁₇O).

(4) *Mathematical notation:* The conventional method of representing mathematical quantities and operations by means of symbols. [SYMBOL.]

(5) *Musical notation:* The system or method of expressing musical sounds in writing, by means of signs, characters, figures, or marks. [NOTE, s.]

(6) *Numerical notation:*

 (2) In particular, the signs placed upon the stave which show by their shape and position the duration and pitch of sound. They constitute the essence of measurable music as opposed to mere "signs of intonation," such as were the neumes. The first division of notes was, as might be expected, into long and short (breve or long). The long was a four-sided note with a tail (♩); the breve a four-sided note without a tail (♪); the semibreve a diamond note (♩). There are now six notes in ordinary use: viz., the semibreve (♩); the minim (♪); the crotchet (♫); the quaver (♬); the semiquaver (♭), and the demisemiquaver (♮). The half-demisemiquaver (♯) is also occasionally used. One semibreve is equal to two minims, or four crotchets, or eight quavers, or sixteen semiquavers, or thirty-two demisemiquavers, or sixty-four half-demisemiquavers.
 (3) The term is used generally for the sound of which notes are signs, as when we say of a singer that his high notes are good, or that a player plays wrong notes.

Philos.: (See extracts).

"*Nomenclon* is the antithesis to phenomenon. . . . *Nomenclon* means the substance, or, to use the Scholastic word, the substance. Thus, as matter is recognized by us only in its manifestations (phenomena), we may logically distinguish these manifestations from the thing manifested; and the former will be the *interea videri quoniam*, the latter the *interea in qua*. *Nomenclon* is, therefore, equivalent to the Essence; phenomenon to the manifestation." — *Id.*, *Il. Lewis, Hist. Philos.*, i. 70. (S.O.S.)

"The notion of a *nomenclon* is therefore no concept of an object, but the problem unavoidably connected with the limitation of our sensibility, viz., whether there may not exist objects quite independent of its limitation—a question which can only be rationally answered by saying that as our sensuous intuition does not apply to all things indiscriminately, there is a *room* for more and for other objects, so that they cannot be absolutely denied, but neither, in the absence of any definite notion, can they be admitted as objects for our understanding." — *Kant, Critick* (ed. Mohrly), p. 206.

• *The Fourth Book of Moses, called Numbers*: *Old Test. Canon*. The fourth book of the Pentateuch. In the Hebrew Bible it is called **בְּרָאשִׁית** (*Bē-midh-bār*) = in the desert, the fifth word of the first chapter. It has been sometimes quoted also as **בְּרָאשִׁית** (*B'ayidibbēr*) = And he spake—this being the first word of the book. The Septuagint translators named it *Ἀριθμοί* (*Arithmoi*) = Numbers. The reference is to two numberings of the Israelites. Chaps. i-iv. give the details of the first census, and prescribe the order in which the tribes were to encamp, and the arrangement and duties of the Levites; v. and vi. contain laws, including those relating to the Nazarites; vii. contains the offerings at the dedication of the tabernacle; viii.-x. 28, other laws and arrangements; x. 29-xiv., the historic narrative, including the sending out of the spies; xv. other laws; xvi. and xvii. the rebellion of Korah, Dathan, and Abiram, with the bidding of Aaron's rod; xviii. and xix. Levitical laws, xx. and xxi. the striking of the rock, followed by a miraculous flow of water, the making of the brazen serpent [NEHT-SHTAN]; xxii.-xxiv. Balaam's prophecies; xxv. sin with the Midianites; xxvi. the second census; xxvii.-xxxii. other laws and incidents, including the conquest of the Midianites; xxxiii.-xxxv. the distribution of the land east of the Jordan; an itinerary of the journey out of Egypt; the establishment of Levitical cities, and provision in cases of homicide by misadventure. The last chapter (xxxvi.) contains some provisions for the marriage of heiresses, so as to retain their inheritance in their own tribes.

The book spans a period of nearly thirty-nine years, commencing with the second year of the wanderings, the second month, and the first day, and terminating in the fortieth year. The Jews and the Christians of early and mediaeval times implicitly believed in the Mosaic authorship of Numbers. Modern rationalists resolve the book into different portions, assigning each to a separate writer. One eminent critic of this school considered that 274 verses of Numbers constituted the original narrative; that six verses, appearing to belong to writings of some older time, were inserted by the Deuteronomist (q.v.), and the remaining 1,008 verses—more than three-fourths of the book—belonged to the Later Legislation. The 274 verses of the original narrative are thus given:—

"Ch. v. 22-36; vi. xli. xlv. 1-3, 17-20, 22-24, 26 (except to Kadesh, 27-31, 33); xiv. 11-25, 39-45; xvi. 1, 2, 12-15, 23-34 (except Korah, ac. in vers. 1, 24, 27, 32); xv. 1, 14-22; xvi. 1, 13, 16-26, 31-35; xlii. 1-4; xliii. xlv. xlv. 1-5; xxxix. l. 16-24, 33-42."

The six verses from old sources assigned to the Deuteronomist are xli. 14, 15, 27-30. (*Numbers: On the Pentateuch*, vi. 88.) These views created some excitement when first published, but they have failed to make any considerable impression on the Christian public.

II. Alg. & Arith.: A term which stands opposed to literal, and implies that the numbers composing a given expression are denoting by figures, and not by letters. A numerical equation is an equation in which all the quantities, except the unknown or variable quantities, are numbers. Numerical, as opposed to algebraical, is applied to the values of quantities; thus we say, that -5 is numerically greater than -3 , although its algebraical value is less. The numerical value of an expression, in algebra, is the number obtained by attributing numerical values to all the quantities which enter the expression, and performing all the operations indicated. Thus, the numerical value of $a^2b - c^2d$, where $a = 2$, $b = 3$, $c = 1$, and $d = 2$, is 10.

"The *numerical* value of a concrete quantity is its ratio to a selected magnitude of the same kind, called the unit. It varies directly as the concrete quantity itself, and inversely as the unit, in terms of which it is expressed."—*Everett: C. G. S. Syst. of Units* (1876), p. 1.

Optics: The formula by which the illuminating and resolving power of high-power microscopic objectives is now calculated. Since it became customary to interpose water, oil, or other fluid between the object and the lens, it is found that a water-immersion lens of 95 λ , and an oil-immersion of 82 λ , give equal results to a dry or air lens of 180 λ . This obviously depends on the diameter of the back lens of the objective, and thus upon the refractive index of the medium between lens and object. It is expressed by the formula, $n \sin u$, where n is the refractive index of the medium—air or fluid—and u the semi-angle of aperture. It is thus found that an oil-lens of 180 (oil of ref. index 1.52) has an N.A. of 1.52 against 1.00 for 180 λ in air. This only represents the comparative diameters of the effective pencils, and the relative illumination is, of course, obtained by squaring the N.A.'s to get the comparative areas of the pencils. We thus find that an oil-lens of 180 gives 2.310 the illumination of a dry objective of 180 λ .

1. A virgin or widow who has consecrated herself to the service of God by the three vows of poverty, chastity, and obedience, and bound herself to live in a religious house under a certain rule. The first authentic notice of nuns is that by St. Antony, who, when retiring from the world, placed his sister in a house of virgins. St. Augustin, of Hippo, and St. Scholastica, sister of St. Benedict, both founded nunneries, and all the great orders of men have orders of women affiliated to them or through their rule as closely as difference of sex will permit. Communities founded since the Council of Trent mostly follow the rule of St. Augustin, with certain modifications. Nearly all nuns are bound to the recitation of the divine office in choir, and take their meals in common, but each has a separate cell. Their occupations vary. Some devote themselves to the work of education, to nursing the sick, or the care of the poor. Others are contemplative. Excommunication is denounced against any one attempting to force a woman to become a nun against her will, or to prevent her from becoming a nun without just cause. Since the Oxford movement several communities of religious women have been established in England. [DEACONESS, PROFESSION, VEIL.]

¶ *II. Technically*:

1. *Astron.*: As the attraction of the sun, tending to drag the equator down to the ecliptic which causes the precession of equinoxes [PRECESSION], is greatest at the solstices and ceases at the equinoxes, the precession of the equinoxes cannot be uniform, but varies from time to time. Similarly the moon produces a slight variation in different parts of her monthly revolution. But besides this, the moon, which does not move in the ecliptic but in an orbit inclined to the plane of the ecliptic, has a movement like that of the precession of the earth's equinoxes, which causes the place of the intersection of her orbit with that of the sun to revolve every nineteen years. During half of this time the moon's path is little inclined to the earth's equator, while during the remaining portion of the time it is much inclined. Hence her influence over the time of the earth's equinoxes is unequal. The irregularities in the movement of the earth's equinoxes and her axis caused in the three ways are called nutation. Philos.: One of the six schools of Brahmanic philosophy, and regarded as eminently orthodox. It was founded by Gotama, who must not be confounded with the Gotama or Gautama generally looked on as the founder of Buddhism, though the tenets of both were much akin. The Nyaya philosophy begins with the assertion that supreme felicity is derivable from true knowledge. Ignorance, by producing faults and activity, became the cause of birth. The world is a compound of good and evil, pleasure and pain; but it must be renounced, effort and activity abandoned, and the soul separated from body and mind. The world is held to be in a state of suffering, the doctrine of the transmigration of souls accepted, and men are urged to look forward to final emancipation from pain, birth, activity, fault, and false notions, in which case they shall attain supreme felicity. [*Banarjan: Dialogues on the Hindu Philosophy.*]

O.

O. The fifteenth letter, and the fourth vowel of the English alphabet. The shape of the written letter was probably suggested by the circular formation of the lips in uttering the sound. *O* is called the labial vowel, *i* being the palatal vowel, and *a* the guttural. In English *o* has six distinct sounds or shades of sound: (1) The sound of *o* in *not*, as in *pot* (marked in this book **ô**). (2) The same sound lengthened by a following *r*, as in *or*; and in the digraph *ou*, as in *fought*, *sought* (un-

marked, **o**). (3) The sound of *o* in *o*; and in the digraphs *oa*, as in *foe*, *toe*; *oo*, as in *ooze*, *moon*, *boat*; and *oo* in *tooth* (marked **o**). This sound is modified by following the vowel, as in *more* (marked **o**). (4) The sound of *o* in *who*, *more*, *tooth*; and in the digraphs *oo*, as in *room*, *soon*; and *oo*, as in *through*, *wound* (marked **ô**). (5) The sound of *o* in *bull* or *fall*, as in *wool*, *wooman* (marked **o**). (6) The sound of *o* in *tho*, as in *son*, *ho*, *com*; and in the digraphs *oa*, as in *doe*; *oo*, as in *blood*; *oo*, as in *rough*, *tough* (marked **ô**). The long *o* in modern English, as in *go*, represents an A. S. *o*, as in *boon* = A. S. *boan*, *hoof* = A. S. *hif*, *stone* = A. S. *stan*.

O. As a symbol is used:

1. As a numeral.

(1) Amongst the ancients for 11, and with a stroke over *O* for 11,000.

(2) Now as the symbol of nothing, or a cypher.

2. In chemistry for the element oxygen.

5. A cry to call attention, or to command a cessation of noise, &c.

B. As interj.: An exclamation used in earnest or solemn address, entreaty, appeal, or invocation, and prefixed to the noun of address. Attempts have been made to distinguish between *O* and *Oh* by some writers; namely that *O* should be used only in direct address to a person or personified object, and should never be followed by the exclamation point, while *Oh* should be used in mere exclamations, where no direct address or appeal is made to the object, and may be followed by the exclamation point or not, according to the nature or construction of the sentence. This distinction is, however, merely arbitrary, and is not regarded by most writers, even the best, the two forms being generally used indiscriminately.

"*O*, be not proud."—Shakesp. *Temes & Adonis*, 112.

ô, *pref.* [Ir. *o* = a descendant; Gael. *oibh*; Scotch *o* = a grandson.] A common prefix in Irish surnames, and meaning son of; equivalent to Mac in Gaelic, Fitz in Norman French, and the suffix *-son* in English surnames.

I. A solemn affirmation or declaration made with an appeal to God for the truth of what is affirmed. By the appeal to the Supreme Being, the person making oath is understood to invoke His vengeance if that which is affirmed or declared is false; or, in case of a promissory oath, if the promise or obligation is wilfully broken. Oaths are of two kinds: (1) Assertory oaths, or those oaths by which the truth of a statement is affirmed; as an oath sworn to the truth of an affidavit; (2) Promissory oaths, or those oaths by which something is promised, or an obligation is assumed; as, the oaths of witnesses; the oath of allegiance, by which the person taking the oath promises allegiance (q.v.) to the sovereign. Modern legislation has also provided particular forms of oaths for Jews; has permitted affirmations to be made by persons who have conscientious objections to take an oath; and has otherwise greatly relieved the King's subjects generally from the penalties and disabilities consequent on the neglect or refusal to take the oaths. Witnesses are allowed to swear to the truth of

II. Technically:

1. **Bot.:** Panic-grass; a plant of the genus Panicum.

2. **Chem.:** The meal of the oat deprived of its husk. It is one of the most important and valuable articles of food, containing a greater proportion of protein compounds than the finest wheaten flour. An analysis of a sample of Scotch oatmeal gave 13 per cent. of nitrogenous material, 60-70 per cent. of heat givers, and 3 per cent. of mineral matter. It is a strong food, and requires much cooking in order to burst its starch cells; the longer it is cooked the more digestible it becomes. Oatmeal is frequently adulterated with barley meal; this is readily detected by the microscope, the granules of the barley being round, and very much larger than those of the oat.

It contains only one chapter of twenty-one verses, denouncing vengeance against the Edomites for their unbrotherly conduct, when, on the occasion of the capture of Jerusalem by a heathen foe, they helped to plunder that capital, besides cutting off fugitive Jews and surrendering refugees (1-14). Prophecy is then made of the future glory in store for the Jews (17-21). It, as is probable, the capture of Jerusalem referred to was that by Nebuchadnezzar, then the book was written after the year B.C. 588. It is related to Jeremiah xlix, 7-22. (Cf. specially Obadiah 1-6, 8, 16, with Jer. xlix, 14, 15, 16, 9, 10, 7, 12. 2. *Arch.:* A quadrangular, slender stone shaft, with a pyramidal apex. The width of

the base is usually about one-tenth of the height, and the pyramidal apex has about one-tenth of the whole length. Obelisks were commonly formed from a single stone, mostly of granite. There are, however, two small obelisks in the British Museum formed of basalt, and one at Philæ of sandstone. Obelisks were erected in pairs, and many still exist on the ancient sites, while others have been removed and set up elsewhere. The first obelisk is said to have been erected by Rameses, King of Egypt, in the time of the Trojan war; it was 40 cubits high, and employed 20,000 men in building. There are about a dozen Egyptian obelisks erected in Rome. The largest is that from Heliopolis. It is of granite, and now stands before the north portico of the Church of St. John Lateran, where it was erected in 1588. Its whole height is about 149 feet; without the base, 105 feet. It was removed to Alexandria by Constantine, and to Rome by his son Constantius, and placed in the Circus Maximus. The obelisk at Luxor was presented to the French nation, in 1820, by Mehemet Ali, and was re-erected in Paris in 1835. Its height is 73 feet. The obelisk at Alexandria, known as Cleopatra's Needle, and presented to the English nation at the same time, was allowed to lie prostrate and half buried by the sand, until removed to England and set up on the Embankment in London, at the cost of the late Sir (then Mr.) Erasmus Wilson. It is 68 feet 5½ inches in height, with a width at the base of 7 feet 10½ inches by 7 feet 5 inches.

o-bi, s. [OBTUL]

Anthropology:

1. A system of sorcery prevalent, though not to so great an extent as formerly, among the negro population of the West India colonies. It appears to have been brought from Africa by negroes who had been enslaved, and to these obeah-men (or women) the blacks used to resort for the cure of disorders, obtaining revenge, conciliating favour, the discovery of a thief or an adulterer, and the prediction of future events. The practice of obi had become so general towards the close of the last century, that a report on the subject was sent to the Lords of the Committee of the Privy Council by the agent of Jamaica; and from that document, and from the reports, there is little doubt that the obeah-men exercised vast influence, and that they carried on a system of secret show poisoning, the effects of which were attributed by their more ignorant fellows to obi.

2. The magical power or influence by which the purposes enumerated in def. 1 were supposed to be obtained.

* The multitude of occasions which may provoke the negroes to exercise the powers of obi against each other. —*B. Edwards' Brit. West Indies* (ed. 1829), ii. 111.

3. A kind of fetish in which the power known as obi was supposed to reside.

* The obi is usually composed of a farinose of materials, most of which are comminuted in human clay, viz. blood, feathers, parrots beaks, dogs teeth, rattles, broken bottles, grave-dut, rum, and egg-shells. —*B. Edwards' Brit. West Indies* (ed. 1829), ii. 111, 112.

* *Tupat obi-on*: To bewitch by means of obi. When this was done for purposes of revenge, the person on whom obi was put usually fell into a morbid state of body and mind, terminating only by death. This was either the effect of a disordered imagination, or, more probably, of poison.

* She proceeded to say that her stepmother had put obi upon her. —*B. Edwards' Brit. West Indies* (ed. 1829), ii. 115.

1. *Ordinary Language*:

1. The act of occupying or taking possession.

2. The act of occupying or holding in possession; the time during which one occupies or has possession of anything; the time during which one is an occupant.

II. *Law*: The taking possession of those things which before belonged to nobody, and the right acquired by so taking possession. This, the original and only primitive method of acquiring any property, has been restrained and abridged by the laws of society, in order to maintain peace and harmony among mankind. For this purpose, gifts, contracts, wills, legacies, &c., have been introduced, in order to transfer and continue that property and possession in things personal which has once been acquired by the owner. In some few instances this original right of occupancy is still permitted and recognised. Thus, the benefits of the elements, the light, the air, and water can only be appropriated by occupancy.

"Occupancy is the taking possession of those things, which, so far as it concerns real property, has been ordained by the laws of God and with a very narrow compass. It extended only to a single instance, namely, where a man was tenant *par terre* *en fee*, or had an estate granted by himself only, without mentioning his heirs, for the life of another man, and died during the life of *estoyage* *en fee*, or him by whose life it was holden in this case, he that could first enter on the land might lawfully retain the possession, so long as *estoyage* *en fee* lived, by right of occupancy. This seems to have been recurring to first principles, and calling in the law of nature to ascertain the property of the land, when left without a legal owner. For, had the estate *par terre* *en fee* been granted to a man and his heirs during the life of *estoyage* *en fee*, there the heir might enter and hold possession, being called in law as *heir at law*. But the rule of occupancy is now reduced almost to nothing by two statutes, directing that the estate *par terre* *en fee* after payment of 40 sh. shall go in a course of distribution like a child at law. . . . But the rule of occupancy, by the heir at law, continues to this day; such heir being held to succeed to the ancestor's estate, not by descent, but as an occupant specially appointed by the original grant. If no special occupant be named, when the estate *par terre* *en fee* is of a freehold or any other tenure, it shall go to the person representative of the person that had the estate thereof by virtue of the grant, and be distributed like a child at law, to the personal estate of the testator or intestate." — *Blackstone's Comment*, bk. ii., ch. 14.

ō dōm-č-ter, *s.* [Gr. *ōdōmetron* (*holometron*), from *ōdos* (*hodos*) = a way, a road, and *metron* (*metron*) = a measure; Fr. *odometre*.] An instrument employed for registering the number of revolutions of a carriage-wheel, to which it is attached. Two wheels of the same diameter, and turning freely on the same axis, are placed face to face; the edge of one is cut into 100 teeth, and that of the other into 99 teeth, and an endless screw works into the notches in each wheel. When the screw has turned 100 times around, the wheel having 99 teeth will have gained one notch on the other, which gain is shown by an index attached to one wheel, which passes over a graduated arc on the other. Every hundred turns are thus registered on the second wheel, and all turns less than a hundred are shown by a separate index. Now, instead of the screw turning on its axis, it is found more convenient to have the screw fast, and to allow the weight of the machine to be suspended freely, so that as the carriage wheel turns, the effect is the same as turning the screw on its axis.

Old Catholics, *s. pl.*
Old Catholics. The name assumed by a body of German priests and laymen who refused to accept the dogma of Papal infallibility, and, in consequence of its definition, formed themselves into a separate body. It was essentially a University movement, for the German bishops who had left Rome to avoid voting—Helele among the number—afterwards submitted. Van Schleier, a professor at Prague, published a formal protest; then came the Nuremberg protest of "Catholic professors" (Aug., 1870). Father Hyacinth's "Appel aux Evêques" followed in *Le Libérateur* in 1871, and (March 28) Dr. Dollinger set forth his reasons for withholding his assent "as a Christian, a theologian, an his-

torical student, and a citizen." Dollinger and Friedrich were immediately excommunicated. In the September following a Congress was held at Munich, when it was resolved to seek reunion with the Greeks. In 1872 a second congress was held at Cologne, at which Dean Stanley was present, and sent an account to the *Times*, which aroused much interest in England. On Aug. 11, 1873, Dr. Reinkens was consecrated at Rotterdam by Dr. Hey de Kamp, Jansenist Bishop of Dventer, and, in 1876, Dr. Reinkens consecrated Dr. Herzog. The first synod (1874) made confession and fasting voluntary; the second (1877) reduced the number of feasts, and admitted only such impediments to marriage as were recognised by the State; the third (1876) permitted priests to marry, but forbade them to officiate after marriage. This prohibition was annulled by the fifth synod (1878), and, in consequence, Friedrich, Reinsch, and some others withdrew. Congregations of Old Catholics exist in Austria, Italy, Spain, Switzerland, France, and Mexico, but their numbers are small. In Germany they seem to be dwindling away, but the project of Dollinger and his fellows will remain an important landmark in religious history.

II. Technically:

1. *Bot.*: *Olea europæa*. The leaves are oblong or lanceolate, smooth above but horny beneath; the small white flowers in axillary, erect racemes; the ellipsoidal fruits bluish-black, lerry-like, and pendulous. It is rarely above twenty-five feet high, but is of slow growth, and reaches a great age. Two varieties are known, the Oleaster (q.v.), not to be confounded with any of the modern order Thymalacæe, and the cultivated variety. The former is spiny, and has worthless fruit; the many sub-varieties of the latter are unarmed and have large, oily fruits. The specific name *europæa* implies that Europe was its native continent, which is doubtful. Its original seat was probably western Asia, and perhaps Europe as well. It was very early brought into cultivation, and in classic times was sacred to Minerva. It was very abundant in Palestine, and even yet there are fine olive plantations near Jerusalem, Nablus (formerly Shechem), &c. It is often mentioned in the Old Testament by the Hebrew name **זית** (*zîth*), and in the New by that of *ἄλαια* (*alêia*). Both are correctly translated olive. The Mount of Olives was named from it, and *tiethenane* means an oil-press. The tree has been introduced into and is cultivated in the countries bordering on the Mediterranean, and in some mountainous parts of India and Australia. The unripe fruits are pickled, and the ripe olives used for the manufacture of olive-oil (q.v.).

2. *Chem.*: When ripe, olives weigh about 30 grains each, and contain 25 per cent. of water, and 69 per cent. of fat. When scarcely formed they contain a considerable quantity of mume, which disappears as the fruit ripens.

on toğ on y. [ONTOGENESIS] *Ph.* — An argument for, or proof of the existence of God, derived from the very idea which may have God, the greatest object or being that can be conceived. This conception exists in the intellect of all such as have the idea of God, and in the intellect of the atheist as well, for he understands what is expressed by "the absolutely greatest." But the greatest cannot be in the intellect alone, for then it would be possible to conceive something still greater, which should exist not only in the intellect, but in external reality. Hence the greatest must exist at the same time in the intellect and in the sphere of objective reality. God, therefore, is not simply conceived by man; he also truly exists. The ontogenic argument was first formulated by Anselm (1033-1109), and was revived in the seventeenth century by Descartes. (*Urbano.*)

1. *Petrol.*: A variety of limestone, composed of grains, like the roe of a fish, each of which has usually a small fragment of some organism or a grain of a mineral as a nucleus, around which concentric layers of calcareous matter have accumulated. [PISOLITE.] (*Lyell*)

2. *Geol. & Palæont.*: The term is not now generally petrological, but is chiefly chronological, being applied to a certain considerable portion of the Secondary period and to the strata then deposited. A band or belt of oolitic rocks, about thirty miles in breadth, crosses England obliquely from the coast of Yorkshire to that of Dorsetshire. The oolite is thus divided: —

- I — UPPER OOLITE.
 1. British: (1) Purbeck beds; a. Upper, b. Middle, c. Lower; (2) Portland stone and sand; (3) Kelloway Rock.
 2. Foreign: (1) Marnes and *Graphæa virgata* of Argonne; (2) Lithographic Slate of Solenhofen.
- II — MIDDLE OOLITE.
 1. British: (1) Coral Rag; (2) Oxford Clay; (3) Kelloway Rock.
 2. Foreign: Nereinean Limestone of the Jura.
- III — LOWER OOLITE.
 1. British: (1) Cornbrash and Forest Marble; (2) Great or Bath Oolite; (3) Stonesfield Slate; (4) Fuller's Earth of Bath; (5) Inferior Oolite.
 - Foreign: Undetermined.

The oolitic rocks affect the physical geography of the parts of England which they traverse. The clays and shale, decaying rapidly, give rise to long valleys, and the calcareous strata of the Upper, Middle, and Lower Oolite make three parallel ridges, the chalk above constituting a fourth. A similar appearance is produced in the same way in France between Paris and Metz. During the Oolitic period England and Europe were largely covered by the sea, not enough to be studied in places with coral reefs and contain certain cephalopods like Ammonites and Belemnites. At intervals muddy sediment so clouded the water as to kill the coral animals. This series of events was repeated more than once. Islands in the sea had a vegetation of Cycads, Ferns, Conifera, &c. Reptiles abounded, birds had apparently come into being [ARCHÆOPTERYX], and mammals of the Marsupial type. Some trap rocks in the Morea, in the Apennines, &c., seem to have proceeded from volcanoes active at this time, and some granites in the Alps appear contemporaneous. [JURASSIC.]

ōp-ēr a, s. [Ital. = work, performance, from Lat. *operari* = work, from *opus*, genit. *operis* = work; Fr. *opéra*; Sp. *opera*.]

1. A dramatic entertainment, in which music forms an essential and not merely accessory part. The opera is composed of solos, recitatives, duets, trios, quartets, or other pieces for single voices, choruses and finales; accompanied throughout with instruments variously combined to produce certain desired effects. Overtures or introductions precede the whole work of its several acts in nearly every case. The dramatic effect is heightened by the accessories of costumes and scenery, but they are not absolutely indispensable. The libretto or book of words rarely possesses any claim to literary merit, but serves as a mere framework for the composer. In many of the German and French operas of a lighter character spoken dialogue is introduced in the place of recitative, and the same practice is often observed in English opera, so called. There are many varieties of opera, but the chief are: the grand opera or *opéra seria*, the romantic opera or *opéra dramatique*, and the comic opera or *opéra bouffe*, for which the French term *opéra bouffe* has been adopted in England and America. The opera is of Italian origin, and of comparatively modern date, and is the immediate successor of the miracle-plays with music.

Survey* (1875), vol. v.) enumerates three species. *Ophibolus getulus* is the King-snake of America, a deadly foe of the rattlesnake, which it overcomes and devours. An equal antipathy exists between it and the Moccasin-snake, on which account the King-snake is protected in the Southern states.

Mus.: A wind instrument of metal, invented to supersede the serpent in the orchestra and in military bands. It consists of a wide conical tube, terminating in a bell like that of a horn, having ten ventages with keys, and a mouthpiece like that of the serpent. There are two sorts of ophicleides, alto and bass. The bass ophicleide is written on the F-clef, and its compass is three octaves and one note, from B on the third space below the bass staff, to C on the third space of the treble staff. They are in two keys, C and B \flat . The alto ophicleide has a compass similar in extent to that of the bass instrument, but starting from a note one octave higher. This instrument is not so satisfactory as its bass fellow, and is therefore but rarely heard. The double-bass ophicleides are in F and E \flat , a fifth below the bass ophicleides in C and B \flat . The amount of breath required to play the double-bass ophicleide will probably prevent its general adoption.

OPHICLEIDE.

 1. *Zool.*: Snakes; an order of the class Reptilia, which is placed by Prof. Huxley in his division, Sauropsida (q. v.). The body is always cylindrical and vermiform, covered with horny scales, but without a bony exoskeleton. Vertebræ procelous, with rudimentary transverse processes. They have no sternum, peritoneal arch, forelimbs, or sacrum; not, as a rule, any traces of hinder limbs present, though they occasionally occur, e. g., in Python (q. v.). Hooked conical teeth are always present, ankylosed with the jaw. [Pitons-Fangs.] The order is pre-eminently tropical, the species rapidly diminishing as the distance from the Equator increases, and wholly ceasing before the Arctic or Antarctic Circle is reached. The classification is not fixed. According to Wallace, the order contains twenty-five families. There is another and natural division into three sub-orders: (1) Thanatophidia (Venomous Snakes), with two groups, Proteroglypha and Solenoglypha; (2) Colubiformes (Innocuous Colubiform Snakes); and (3) Typhlopheidia (Blind Snakes).
 2. *Palæont.*: First found in the Eocene of Sheppey, others from Miocene of Germany,

and in some Tertiary beds in the United States. Most of these appear to have belonged to the Pythonidae. Poison-fangs have been found in some of the later Tertiary deposits, and a colubrine snake from the Upper Miocene of the South of France. (Falconer.) The more important genera will be described under their names.

opium traffic, s. *Hist.* &c.: In China, India, Turkey, and other parts of the East, and, to a small extent, in the West, opium is used as a narcotic drug. The great source whence China has always derived its opium has been India, where, since 1793, the drug has been a government monopoly, the cultivators in Behar, Benares, and Malwa being paid at a fixed rate for their crops for exportation to China. The trade, which was conducted in clippers, was contraband; the Chinese government having in 1796 prohibited the importation of opium,

OPISTHOCOMUS CRISTATUS.

and issued various subsequent proclamations on the subject, of the same tenor as the first. Nevertheless, by the connivance of the Chinese local officers, the opium trade continued to flourish in the twenty years between 1816 and 1836-37, in the two latter years being 20,449 chests, valued at more than £2,000,000. In March, 1839, the Chinese authorities, without warning given, enforced the law, forbade all foreigners to quit Canton, and ordered them to deliver up the opium in their possession, which was burnt. War with Britain resulted, and the Chinese were obliged to pay an indemnity for the opium. They have since been compelled to admit it, but the religious community dislikes the opium traffic, and at times takes active steps for its abolition. A Royal Commission, in its report of 1895, suggested increased State supervision over its growth and manufacture in India, a report accepted by the Imperial Government.

1. Pertaining or relating to sight or vision; pertaining to the organ of sight; as, an *optic nerve*, &c.

2. Used for vision; aiding or subservient to the sight.

"A spot like which perhaps Astronomer In the sun's lucent orb Through his glazed optic tube yet never saw." *Milton: P. L., iii, 509.*

* 3. Pertaining or relating to the science of optics; optical.

B. As substantive:

1. The angle included between two lines drawn from the two extremities of an object to the centre of the pupil of the eye; the visual angle. (See illustration.)

2. The angle which the optic axes of the eyes make with one another as they tend to meet at some distance before the eyes.

optic axis, s.

1. *Optics*: The straight line joining the centre of the eye and that of any object immediately in front of it.

optic commissure, s. [CHIASMA.]

Anat.: A foramen in the back of the eye, affording a passage to the optic nerve and the ophthalmic artery.

optic lobos, s. pl.

Comp. Anat.: The homologues in amphibia, fishes, and birds of the mammalian *corpora quadrigemina*, the principal nervous centres for the supply of sight. The destruction of one produces blindness on the opposite side. They are situated in the medulla oblongata, between the spinal cord and the cerebellum.

optic nerve, s.

Anat.: The nerve of sight, proceeding from the optic lobes or *corpora quadrigemina* to the eye, terminating in an expansion called the retina. The inner portion of the fibres of the two optic nerves decussates at the commissure, passing to the opposite eye, whilst the outer portion continues its course to the eye of the same side, which has been supposed to assist in the production of single vision, although it is more probable that the latter is the result of a mental act. The closest relations exist between the optic nerve, its disc, the retina, and the chorioid, as regards the cerebral and intra-ocular circulation, particularly seen in the course of cerebro-spinal disease.

optic neuritis, s.

Pathol.: A lesion of the optic disc, usually associated with meningitis of the base of the brain, tumours, and large hemorrhages. It is marked by serous infiltration and papillary prominence, commencing in the neurolemma, the pupils often dilated, but in simple atrophy contracted, going on in unfavourable cases to congestion, and ending in the most hopeless form of blindness, from primary or progressive atrophy. By the ophthalmoscope alone can any opinion be formed of the significance of the various appearances in optic neuritis, which is of the gravest character.

optic-thalami, s. pl.

Anat.: Two ganglia, situated between the *corpora striata* and the *corpora quadrigemina* on each side of the third ventricle, composed of gray matter. With the gray substance of the *pons* and the other centres of gray matter they constitute, as shown by Dr. Carpenter, the real sensorium.

optic tracts, s. pl.

Anat.: Two flattened white cords crossing the peduncles or crura of the hemispheres of cerebrum.

It consists of a box containing two plane mirrors, set at an angle of 45° with each other, so that the image of an object reflected from one mirror to the other will form an angle of 90° with its true position, indicating the correct direction in which a perpendicular offset to the main line shall be measured.

Between the eye and the speculum is a pair of parallel faced glass with a small dot in its centre, exactly in the focus of the eye-glass. By moving the pencil, the dot seen in the field of the telescope is passed over the outlines of the object, which are at the same time traced on the paper by the pencil.

1. *Philos.* The name given to the view propounded in the *Discourses* of Leibnitz, that this world, as the work of God, must be the best among all possible worlds, for were a better world possible than that which actually exists, God's wisdom must have known, His goodness must have willed, and His omnipotence must have created it. Leibnitz maintained that, if there was to be a world, it must consist of finite beings; this is the justification of finiteness and liability to suffering, or metaphysical evil; that physical evil, or pain, is salutary as punishment, or means of tuition; and that God could not remove moral evil, or wrong, without removing the power of self-determination, and, therewith, the possibility of morality itself. J. S. Mill (*Principles of Political Economy*, p. 49) points out that Leibnitz did not maintain that this is the best of all conceivable, but of all possible, worlds, so that his doctrine (though not that of his disciple, Pangloss) might be held by a rationalist Theist.
2. The belief to take the most hopeful view of matters in general; the belief that the world is growing better.

Roman Theol.: Usually employed adverbially (*ex opere operantis*). The phrase (= the work of the worker) is used to signify that the effect of a particular rite or act of devotion is directly due, not to the rite (*opus*) itself, but to the dispositions of the person who is the subject of the rite or who practises the devotion. This is the Protestant view of the efficacy of the sacraments, as opposed to the Roman and High Anglican view. [OPUS OPERATUM.]

opus operatum, *phr.*

Roman Theol.: Usually employed adverbially (*ex opere operato*). The expression *opus operatum* (= the work done) was used by medieval theologians to signify that grace was conferred by the sacrament itself, and adopted by the Council of Trent, which, in the eighth canon (*De Sacramentis in genere*) of the seventh session, anathematizes any one who shall say that the sacraments do not confer grace *ex opere operato*. The necessary dispositions on the part of the recipient are *conditiones sine qua non*; and, according to the Roman view, the grace conferred is due, not to these necessary dispositions, but to the sacrament as received with these necessary dispositions.

"When we say the sacrament confers grace *ex opere operato*, our meaning is that grace is conferred by virtue of the sacramental act itself instituted by God for this end, not by the merit of the minister or the recipient." *Belsham*: *De Sacramentis*, lib. ii., l.

II. Anthropol.: Oracles are of high antiquity. They existed among the Egyptians (Herod., v. 81, vii. 82), and the poetry of the Greeks and the Romans is full of allusion to them. The Hebrews might lawfully, by the high priest, consult the Urim and Thummim (Num. xxvii. 21), but they also illicitly sought responses from teraphim (Judges xvii. 5), and from the gods of surrounding nations (2 Kings, i. 2, 3, 6, 16). The responses were supposed to be given by a supernatural afflatus, either through a person, as at Delphi and Cumæ, or through some object, as in the rustling of the sacred grove at Dodona. But in every case there is present the idea of a power more than human taking possession of a person or thing, and making that person or thing the vehicle of the response. (Cf. Num. xxiii. xxiv., Acts xvi. 16; Homer, *Odys.* v. 396; Virgil, *Æn.* vi. 45-51). Tylor holds that the belief in oracles was a consequence of animism, and, after giving instances of the survival of the belief among races of low culture, says (*Prim. Cult.*, ed. 1873, ii. 138), "Could a South Sea Islander have gone to Delphi to watch the convulsive struggles of the Pythia, and listen to her raving, shrieking utterances, he would have needed no explanation whatever of a rite so absolutely in conformity with his own savage philosophy."

Zool.: *Simia satyrens*, the Man of the Dyaks. The name by which it is known in England is Malay, and signifies, "the wild man of the wood." It is a dull, slothful animal, but possessed of great strength. Wallace (*Malay Peninsula*, ch. iv.) says that he was told by a Dyak chief that "no animal dare attack it but the crocodile and the python. He always kills the crocodile by main strength, standing upon it, pulling open its jaws, and ripping up its throat. If a python attacks a man, he seizes it with his hands, and then bites it, and soon kills it. The man is very strong, there is no other animal in the jungle so strong as he." These animals are now confined to the swampy forests of Sumatra and Borneo. Their height has been variously stated, but, according to Wallace (*loc. cit.*), "we have not the least reliable evidence of the existence of Orangs in Borneo more than four feet two inches high." The legs are very short, the arms as disproportionately long, reaching to the ankle when the animal is placed in an erect position. The hair is long, ruddy-brown, with a decidedly red tinge, face dark, eyes and nose small, jaws prognathous, the hair falling over the forehead and backward over the neck; it is long on the limbs, with a downward direction on the upper, and an upward on the lower arm. There are neither cheek pouches nor natal callosities, nor a tail, and the hips are covered with hair. The males have a longish beard, and they sometimes develop warty protuberances on each side of the face. Hence some authorities have discriminated two species, but Dr. Mivart considered them merely varieties. (SIMIA.) The resemblance to man in appearance is greatest in the females and in young animals. The head of a baby Orang is not very different from that of an average European child; but in the adult the muzzle is as well-marked a feature as in the Carnivora. The Orang is arboreal, and forms a sort of nest or shelter among the trees. It never walks erect, unless when using its hands to support itself by branches overhead, or when attacked. Representations of its walking with a stick are entirely imaginary.

II. B to q, a. : Properly Citrus aurantium, the sweet orange. The leaves are ovate, ... slightly serrated; petiole more or less winged; the pulp is sweet. It is a native of India, and by some botanists is believed to be only a variety of the citron (Citrus medica). It was introduced into the south of Europe about the twelfth century, having been brought into Arabia about three centuries earlier. It lives about six hundred years. Among the many varieties are the China orange, which is the common orange of the markets; the Blood, or Malta orange; the St. Michael's orange; the Noble, or Malabar orange, &c. A single tree in St. Michael's has yielded 20,000 oranges in 1400. The orange contains malic acid; the rind is bitter and aromatic; the fruit itself is said to be disunctant. Orange leaves are sometimes prescribed for hysterical females, instead of tea. Orange-poultice has been recommended in Indian skin diseases. Sometimes there is a monstrous separation of the carpels, producing what is popularly called a horned orange. There are various allied species, especially the Bitter, or Seville orange, C. Bergamota, largely imported for the manufacture of candied orange-peel, &c. It, too, has run into several varieties. Another species is the Bergamot (q.v.). Sir Joseph Hooker makes all these varieties of C. Aurantium.

oppose Catholic Emancipation. Orangemen in Ulster wear the flowers of the Orange-lily (Lilium bulbiferum), on July 1 and 12, the anniversaries of the Boyne (1690) and Aughrim (1691), and they also celebrate November 5, on which day the Prince of Orange landed in Torbay (1688).

A. As substantive:
 1. Lit. & Anthop.: The *judicium Dei* of mediæval writers; the practice of referring disputed questions (especially those touching the criminality of a suspected person) to supernatural decision, in the belief that the Deity would work a miracle rather than the innocent should suffer or the guilty escape punishment. Dr. E. B. Tylor (*Folk-lore, Ethn.*, ed. 9th, xvii. 818) says of the practice, that

"in principle, and often in the very form used, it belongs to ancient culture, thence flourishing up to the mediæval European and modern Asiatic levels, but dying out before modern civilization." It existed among the Jews. A wife accused of adultery was required to drink "the bitter water that causeth a curse" (Numbers v. 12-34), and a strangely similar institution exists at the present day among the negroes of the Gold Coast; and ordeal in some form or other is still practised by races of low culture, and by individuals of low culture among races standing in the forefront of civilization. In the Middle Ages in Europe ordeal was sanctioned both by the civil and the ecclesiastical authorities, and was chiefly of two kinds: (1) By fire, a survivor from the early classic times (cf. Sophocles, *Antigone*, 244; Æschylus, *Eumen.*, 284), in which the accused had to walk barefoot on a bed of burning coals; or to take up and carry a piece of red-hot iron from a certain distance. This method was allowed only to persons of high rank; (2) By water, for persons of the middle and lower classes. This was of two kinds. The accused had to take a stone out of boiling water, and if, after a certain time, his arm presented no marks of injury, he was adjudged innocent. In the second case—a common method when witchcraft was alleged, the accused, bound hand and foot, was thrown into a river or pond, and it was believed that a guilty person would float without effort, and that an innocent person would inevitably sink; (3) Wager of battle. [BYRNE, s. B. L.] Besides these three principal methods there were three others in less general use: A supposed murderer was required to touch the body of the murdered man, and was pronounced guilty if blood flowed from the wounds (*Shakspeare, Richard III.*, i. 2); the Ordeal of the Eucharist, in which divine judgment was supposed to follow unworthy reception of the sacrament; and the Corsned (q.v.).

2. *Fig.*: A severe or strict trial through which one has to pass; trying circumstances.

B. As adv.: Pertaining to or connected with trial by ordeal; as, *ordal laws*.

If he recovers, he is deemed innocent; if he die, this is held to prove his guilt. On May 9, 1830, the then reigning Queen of Madagascar administered the ordeal to about thirty men, some noblemen and others of the common people, who were accused of sorcery. The former recovered, the latter died. Certain women, subjected to the same ordeal in April, all recovered.

and reader. Anglicans acknowledge three: bishops, priests, and deacons. The validity of Anglican Orders is denied by the Roman Church. English clergies entering that church, and wishing to become priests, must be ordained by a Roman Bishop. The question assumed great practical importance in connection with the Oxford movement, and the arguments for and against their validity may be seen in Dr. Lee's *Short History of English Orders*, and the late Canon Estlin's *Question of Anglican Orders*, as discussed.

(9) *Religious Orders*: *Eccles. & Church Hist.*: The name Order is popularly given to all associations of a monastic character. Strictly speaking, it is of far less extended application, and is confined to associations which have received the formal approbation of the Roman Pontiff and the members of which are bound by solemn vows. Thus Orders are sharply marked off from Congregations, in which the vows are simple, and for the erection of which the consent of the Ordinary alone is necessary. The term order did not come into use till the tenth century, when offshoots from the Benedictines first appeared, and grew into such communities as those of Cîteaux, Cluny, and La Chartreuse, where modifications of the Benedictine rule were practised. Next in importance come the Mendicant Orders and the Jesuits, the Hieronymites, the Minims, Theatines, Capuchins, and Barnabites. (See these words.)

Dismissals are necessary if a man is to be admitted to a degree other than that in which he was born, and he must have legitimate parents attached to the church. Ordination to sacerdotal orders, according to the general law of the church, can only take place on the Saturdays in the four Ember weeks, on the fifth Sunday in Lent, or on Holy Saturday, and always during mass. Minor orders (q.v.) can be conferred at general ordinations, and also on any Sunday or holiday, not necessarily during mass. The Council of Trent (sess. xxiv, can. 8, *de Bc.*) enacts that sacerdotal orders should be publicly conferred in the cathedral or in one of the principal churches of the diocese, in the presence of the canons, but custom has sanctioned a departure from the practice when a reasonable cause exists. Regulars are usually ordained in their monasteries. (ORDERS, II.)

2. *Ordination*: Strictly speaking, the term ordination is used only of priests, deacons being "made," and no lower order being recognized. Order is not a sacrament in the Anglican Church, though there is more than a tendency on the part of High Churchmen to regard it as such, and the Rev. Orby Shipley (c. s., *Le. vs. Pious*, s. v. *Ordination*) says, "The ordination of priests has generally become united among the five lesser sacraments of the church." (ORDERS, II. (2).) The scale adopted in the case of towns of 1,000 or more inhabitants is $\frac{1}{25000}$ of the linear measurement, or 12572 inches to a mile, or one inch to 41 $\frac{1}{2}$ feet; that for parishes is $\frac{1}{50000}$ of the linear measurement, which is equivalent to 25344 inches to a mile, or one square inch to an acre; that for counties 6 inches to a mile, and that for the general map of the kingdom one inch to a mile. Min. (Pl.): Substances found in the earth from which metals are obtained by various processes, but chiefly by roasting and smelting. Ore consists of metals mineralized by chemical combination with one or more of the non-metallic elements. The principal ores are combinations of metals with sulphur, forming sulphides; with chlorine, forming chlorides; with oxygen, forming oxides; and with carbonic, silicic, sulphuric, arsenic, and phosphoric acids, forming carbonates, silicates, sulphates, arsenates, and phosphates. Generally speaking, however, all mineral substances containing metals, combined or free, are called ores. They are found in veins or lodes, in bedded masses, and also disseminated in rocks of all ages, both igneous and stratified sedimentary. In the latter, the ores of iron and manganese are the most abundant, and often occur in beds of large extent. Some ores, as well as native metals, are also found in alluvial deposits; gold, platinum, &c. in those known as placers; and the oxide of tin in those known as stream-works, from which much ore has been obtained in Cornwall and the Malay Peninsula, and of late years in New South Wales. These have been derived from the degradation and wearing away of older rocks, the minerals having been washed out and re-deposited by the agency of water.

2. *Music*: The most comprehensive and important of all wind instruments. Its history can be traced back to the earliest antiquity. Starting from a small collection of pipes, perhaps even from a syrinx, it has gradually grown in size and complexity until, at the present day, one performer has complete control over many thousands of pipes. The *ἄργαν* (*árgan*), translated "organ," in Genesis (v. 2) and Job (xxi. 12), was probably one of the earliest and simplest forms of a collection of pipes placed over a wind-box or sound-board. In this rudimentary state, the wind was admitted to each pipe at the will of the player by means of a sliding strip of wood, which could be pulled in and out; this mechanism was the ancestor of our modern key-board. The next step was, to have more than one series of pipes; strips of wood passing lengthwise under the mouths of each set enabled the player, by pulling a stop, to exercise a choice as to which he used. Afterwards, as larger organs were constructed, the smaller were called "portative" because they could be carried about in processions, &c., and the large were called "positive" [POST], because they were fixtures. The essential principles of the construction of an organ were thus discovered, and it only remained to expand the instruments (1) by the placing of several organs under the control of one player, with a separate manual or clavier for each; (2) by the use of keys to be played by the feet, or pedals; (3) by the increase of the compass; (4) by the introduction of great variety of tone; (5) by perfecting the bellows and wind-supply, and placing the registers under the organist's control by means of mechanical appliances. It is probable that the use of water in ancient organs (hence called hydraulic organs) was merely for the purpose of graduating the exit of air from a chamber into the pipes. In modern instruments, four, or sometimes even five, rows of keys are found, each representing a distinct instrument; these are named after their use or characteristics; as, Great organ, that used for grand effects, the principal manual; Choir organ, that used for the accompaniment of voices; Solo organ, that containing stops for solo use; Swell organ, pipes placed in a distant box, with shutters opening and closing like Venetian blinds, by means of which a *voce scendibile* is made; Pedal organ, the pipes controlled by the pedals. Pipes range from 32 feet to 4 inch in length; they are divided into two great classes. Flue and Reed, names which need no explanation. The

title of stops generally intimates their quality of tone, *viz.*, Flute, Violin, Oboe, Clarinet, Trumpet, &c. The touch of a large organ is made "light" by levers filled with highly compressed air, hence called *Pneumatic levers*; the long-argy of stops is controlled by composition-pedals, combination-pistons, or fly ventsils; and, lastly, mechanical means have superseded manual labour for blowing.

* By the old writers the instrument was called *the organs*, or *a pair of organs*.

or-i-ŷole, s. [ORIOLEUS.]

Ornithology: *Oriolus*: *Oriolus galbula*, the type-species of the family Oriolidae (q.v.). It not infrequently visits the British Islands in spring, and its conspicuous plumage, bright yellow contrasted with black, chiefly on wings and tail, often brings about its death. Prof. Newton (*Europe, Part. I*, xvii, 844) says that in a few instances it is supposed to have bred in England. The nest is suspended under the horizontal fork of a bough, to both branches of which it is firmly attached; the eggs are of a shining white, sometimes tinged with pink, and sparsely dotted with purple. It is well known on the continent. Its range in summer is as far east as Irkutsk, in winter it is found in Natal and Damaraland. In India it is replaced by *Oriolus chinensis*, and in Asia and Africa there are numerous species resembling it.

2. Pl.: The genus *Oriolus*, or the family Oriolidae.

O-ri-ŷŷn, s. [Gr.]

Class. Mythol.: A celebrated giant and hunter, the son of Hyriens, a peasant, or, according to some, a prince of Tanagra.

2. Astron.: One of the fifteen ancient southern constellations, visible at some season of the year in every land, and a very conspicuous object in the winter sky. A line through the Pole Star and Capella, if produced, will cut it. It is somewhat quadrilateral in form, but has been supposed also to resemble the human form of the mythic giant Orion. On his right shoulder, at an angle of the quadrilateral, is Betelgeuse, a star of the first magnitude; on the left shoulder, at another angle, is Bellatrix, of the second magnitude; on the left ankle, at a third angle, is Rigel; and at the right knee, the fourth angle, is the star κ Orionis. Around the waist, inside the quadrilateral, is a belt with three stars in a line, viz., δ , ϵ , and ζ Orionis, all of the second magnitude. Formerly they were popularly called Jacob's Staff, the Golden Yard of Samson, the Three Kings of Southsayers, &c.; now they are more frequently termed the Gold Grains or Spangles of the Belt. Nearly a hundred other stars are visible to the naked eye in Orion, besides thousands which are telescopic. There is also an irresolvable nebula like the head of a fish below the belt. Its appearances under the spectroscope are those presented when gaseous matter is rendered luminous by heat. The Romans considered Orion to bring with it stormy weather, Virgil (*Æn. I.* 535) calls it "nimboŷus Orion,"

and in other passages he alludes to the belief that this constellation was the herald of coming tempest.

3. Script.: The κ Orionis (κ Orionis) of Job ix. 9, xxxviii. 31, and Amos v. 5, is generally believed to be correctly rendered Orion. *Kesil* means foolish, or a fool, implying that the giant constellation, trusting to its size, was foolish enough to defy Heaven.

or nith ic, *a.* [Gr. *ornis* (ornis), genit. *ornithos* (ornithos) = a bird.] Characteristic of or pertaining to birds.

or nith ich nite, *n.* [ORNITHICHNITES]

Etymology: The English name for any of the fossil footprints, supposed to be those of birds, found abundantly on the sandstone slabs of the Trias, especially in the sandstones of the Connecticut valley. [See extract.] It is, however, doubtful if the first element of the name is justified. Prof. Newton (*Evanc. Brit.*, in 728) says that "the best American paleontologists are now inclined to attribute them rather to Dinosaurian reptiles than to birds."

"Dr. H. Beck, President of Amherst College, United States, first submitted these impressions to scientific attention, and published the interpretation of them having been produced by the feet of living birds, and gave them the name of *ornithichnites*." See *Palaeont. (ed. 2nd)*, p. 225.

or nith ich ni tes, *s.* [Prof. ornith, and *ich-ni-tes*, a suffix.] A footprint.

Etymology: A genus erected by Prof. Hitchcock for the birds which he supposed to have made the fossil tracks in the sandstones of the Connecticut valley. He divided it into two groups: (1) *Archydactyl*, with three species, and (2) *Dactylidactyl*, with five species and three varieties, but remarks, "When I speak of species here, I mean species in ornithology, not in ornithology."

"Some of the specimens of ornithology hitherto described are... I have just had in possession some new specimens... all the varieties of tracks under the name of *Archydactyl*, and it is convenient to speak of this sub-class as a distinct branch of knowledge. For all varieties of ornithology." See *Prof. Hitchcock's Report*, p. 10.

or nith ô dēl phi a, *s. pl.* [Prof. ornitho, and Gr. *delphis* (delphis) = the womb.]

Etymology: A name proposed by De Blainville for the *Megascops* (q.v.), because the uterine enlargements of the oviducts do not coalesce, even in their internal portion, to form a common uterine cavity, but open separately, as in the birds and the Reptiles. In Huxley's newer classification, they form his group Protobirdia (q.v.). They are the Ootocoida of Dana.

or nith ô dēl phi c, *n.* [Mod. Lat. *ornithodelphica*; Eng. suff. *-ic*] Of or pertaining to the Ornithodelphia (q.v.).

or ni thōl ô gist, *s.* [Eng. ornithologia; *-ist*.] One who is skilled or versed in ornithology; one who studies and describes the natural history of birds, their forms, habits, structure, and classification.

or ni thōl ô gy, *s.* [Prof. ornitho; and Gr. *logos* (logos) = a word, a discourse; Fr. *ornithologia*; Sp. & Ital. *ornithologia*.]

Etymology: "The methodical study, and consequent knowledge of birds, with all that relates to them." (*Prof. Newton*, in *Evanc. Brit.*, xviii. 2). It embraces Calidology (which treats of nests), Oology, Pterylogy, and Ornithotomy. Its earliest literature dates from Aristotle (b.c. 385-322), and every succeeding age has added its quota. To two Englishmen, however—Francis Willughby (1625-1672) and John Ray (1628-1705) is really due the credit of laying the foundation of

scientific Ornithology. That part of the science which deals with the classification of birds is an unsettled state; but the fact that old classifications based on external characteristics are of little or no scientific value is now recognized. In the early part of this century Nitzsch made an attempt to introduce a better method. Simevall followed, in the memoir he presented to the Academy of Sciences, Stockholm, in 1835; and Prof. Huxley, in a paper read before the Zoological Society (*Proc.*, 1867, 415-72), in which he made his celebrated announcement that "Birds are greatly modified Reptiles," proposed a morphological classification.

or nith ô măn gy, *s.* [Prof. ornitho, and Gr. *mantra* (mantra) = prophecy, divination.] Divination by observation of the actions, flight, &c., of birds; augury.

or ni thō mý i a, *s.* [Prof. ornitho, and Gr. *myia* (myia) = a fly.]

Etymology: A genus of Pupipara, family Hippoboscidae. The species are parasitic on birds. *Ornithomyia avicularia* infests many birds; *O. hirsutissima*, which resembles a small spider, is usually peculiar to the martin, though Van Beneden (*Animal Parasites*, p. 122) relates a case in which these insects left their feathered hosts to attack the patients in the military hospital at Louvain.

or ni thōn, *s.* [Gr., from *ornis* (ornis), genit. *ornithos* (ornithos) = a bird.] A building in which birds and fowls are kept; an aviary, a poultry house.

or ni thōp tēr a, *s.* [ORNITHOPTERUS.]

Etymology: Birds-wing Butterflies; a genus of Papilionida. The wings, measuring fully seven inches in expanse, are velvety black, contrasted in *Ornithoptera brookiana* with spots of brilliant metallic green, replaced in *O. crassus* by fiery orange, while the body of the latter is golden and its breast a vivid crimson. The species, which are numerous, are distributed over the islands of the Malay archipelago, reaching their maximum of size and beauty in the Moluccas. (*Hallace's Malay Archipelago*.)

or ni thōp tēr ūs, *s.* [Prof. ornitho, and Gr. *pteron* (pteron) = a wing.]

Etymology: An imperfectly-known genus of Pterosauria (q.v.). It comprises forms having a wing-finger, with only two phalanges. It is possibly a transition-form between the Reptile, and Aves, or it may be really referable to the latter class.

or nith ô pūs, *s.* [Prof. ornitho, and Gr. *pus* (pus) = a foot.]

Etymology: Bird's-foot; a genus of Coronillae (q.v.). [BIRD'S-FOOT.]

or ni thō rhyñ chūs, *s.* [Prof. ornitho, and Gr. *rhynchus* (rhynchus) = a beak, a bill.]

Etymology: The sole genus of the family Ornithorhynchidae, founded by Blumenbach (1809), the name Platypus, given by Shaw (1799), being preoccupied. Promaxilla and mandible expanded anteriorly, and supporting a horny beak; teeth in the adult supplied functionally by horny structures; legs short, fitted for swimming; feet webbed, each with five well-developed toes, armed with large claws, and beyond which, in the fore-feet, the interdigital membrane is extended. On the heel of the male is a horny spur, with a basal gland, similar in structure to the poison-fang of a venomous snake. No evidence as to the function of this spur was obtainable till Mr. Speer (*Proc. Roy. Soc. Tas.*, 1876, p. 162) recorded a case in which an animal used this weapon to inflict a severe wound, which was followed by symptoms of local poisoning. Tongue not extensible; tail rather short, broad, and depressed; eyes very small; fur close and soft. A single species, *Ornithorhynchus paradoxus* (Blum.), *O. australis* (Shaw), inhabits Australia and Tasmania. It is aquatic, and feeds on water insects, small mollusca, and worms. For a long time a question existed as to the manner in which this animal propagated its species. The

"black fellows" asserted that it had eggs; and that this fact was known to some Europeans, the following extract from a letter now lying before the writer of this paragraph will show:

"I remember — being amused that — should think the English people—the educated portion—should not know the Flatypus and eggs, for I recollect being told it when a child, and my mother pointing out the curious creature among the stuffed animals in the British Museum."

The question, however, was definitively set at rest by Mr. H. W. Caldwell (Sept. 1854), who has found that the Ornithosuchus, though mammalian in its general structure, is beyond doubt oviparous, laying two eggs at a time. These are about 1/2 in. in the longer, and 1/4 in. in the shorter diameter. The shell is white, strong, and flexible.

1. *Orthoptera*: An order of the class Insecta, having four densely reticulated wings, the anterior more or less coriaceous, the posterior folded under them, and membranous; sometimes apterous. In the most typical groups the wings are detached and closely applied to the body. Mouth mandibulate, metamorphosis incomplete. The order is now usually divided into two sub-orders, Psyllonotoptera (q.v.), and Orthoptera Genuina. The true Orthoptera have been arranged in the following families: (1) Blattellæ; (2) Forficulæ; (3) Lepidoptera of Westwood and the group Dermaptera of Burmeister; (4) Mantidæ; (5) Phasmodæ; (6) Gryllidæ; (7) Locustidæ; (8) Acrididæ. By some authors the Blattellæ and Phasmodæ forming the Grassiaria, and the last three families the Saltatoria. By others the Mantidæ and Phasmodæ are placed in the Curculionida, but nearly all agree in adopting Westwood's classification for the Forficulidæ.

ōs-mī-ūm, s. [Gr. ὀσμῆ (osmē) = an odour.] Chem.: A tetrad metallic element, discovered by Tennant in 1804. Symbol Os, atomic weight 199.2. Occurs combined with

iridium, forming the native alloy osmiridium, in platinum ore. To obtain the metal, osmium tetroxide is digested with hydrochloric acid, and metallic mercury, in a well-closed vessel, at 140°, the osmium being reduced and an amalgam formed. On distilling the amalgam in an atmosphere of hydrogen gas, the mercury and calomel pass over, leaving metallic osmium as a black powder. Its properties vary according to the mode of preparation. In the pulverulent state it is black, destitute of metallic lustre, and has a density of 7. By passing the vapour of the tetroxide, mixed with hydrogen, through a glass tube heated to redness, the metal is deposited as a compact metallic ring, density 10. When heated to the melting-point of iridium, it acquires a density of 21.4. It is the most infusible of all metals. In the finely divided state it is highly combustible, continuing to burn, when set on fire, till it is all volatilised. Osmium forms three chlorides: osmium chloride, OsCl₂; osmio-osmic chloride, OsCl₃; and osmic chloride, OsCl₄; all produced by the action of chlorine gas on osmium. Five oxides are known: osmium oxide, OsO; sesquioxide of osmium, Os₂O₃; osmic oxide, OsO₂; osmium anhydride, OsO₃; and osmic acid, OsO₄. The first three form salts with acids, the fourth is a weak acid, and the fifth is usually regarded as an acid, but its salts are very unstable.

1. Chem.: Osmosis. The mixing of dissimilar substances through a porous diaphragm—a phenomenon due to the attraction which the liquids have for each other. When liquids or gases are separated by a membrane, such as a bladder, it is generally found that the quantities passing in opposite directions are unequal. In the case of water and alcohol the water passes into the alcohol, but only a small quantity of alcohol is found in the water. When a colloidal substance is on one side of the diaphragm and water on the other, the latter only passes through.

1. Lit. (In Athens and some other ancient Greek cities): To vote a person assumed to be dangerous into banishment for ten years by writing his name upon a potsherd or oyster-shell. [OSTRACISM.]
" Their attempts to get him ostracised " —Grotius: Hist. Greece, bk. xxi.

2. Fig.: To banish from society; to place under a ban.

ōs-trā-ĕ-ĭsm, s. [Fr. ostracisme, from Lat. ostracismus, from Gr. ὀστράκαισμός (ostrakismos) = ostracism (see below); ὀστράκαιος (ostrakēaios) = to ostracise, from ὀστράκαιον (ostrakon) = a polished shell of a mollusc.]
1. Lit.: A practice introduced into Athens by Kleisthenes to preserve the democratic government which he had established, and which sooner or later existed also in Argos, Megara, Miletus, and Syracuse. If any citizen became so powerful that it was feared he would attempt to overthrow the government, an ostracism was asked from the Athenian senate and the public assembly. If granted, the citizens each deposited a shell or potsherd on which was written the name of any person of whom they entertained apprehensions, and if a thousand concurred in voting against the same individual, he was required to go into honorable banishment for ten years, retaining, however, all his property.

2. Fig.: Banishment from society, exclusion from society; expulsion.

The branchiæ are attached to the posterior jaws, and there are only two or three pairs of feet, which subserve locomotion, but are not adapted for swimming. A distinct heart is present in Cyprina, but wanting in the freshwater Cypris and the marine Cythere.

1. *Osteithology*:

(1) *Strethion camelus*, from the deserts of Africa and Arabia. It is the largest of all living birds, standing from six to eight feet in height, and has been known from remote antiquity [2]; Xenophon mentions it in the *Anabasis* (l. 5), as occurring in the plains of Armenia, and there are frequent references to it in later Roman literature. Heliodorus is said to have had a dish served up composed of the brains of six hundred ostriches. (*El. Emipridios*). Hunters report that the flesh is palatable, though Browne (*Mercatorius*) remarks, doubtfully, "perhaps boiled and well broiled, after the meat of Apennus, with pepper-mint, dates, and other good things, young ostriches might go down with some stomachic herbs." The ostrich is hunted and food for the sake of the quill feathers of the wings and tail, now used only by ladies, though formerly ostrich plumes decked the helmets of soldiers; still later, the hats of the Cavaliers, and the fashion came in vogue for a time at the Restoration. The ostrich is a vegetable feeder, but swallows stones, bits of iron, and other hard substances to aid the gizzard in its functions. On ostrich farms newly-hatched birds have been observed to peck up little stones before taking any food. The head and neck are nearly naked, body black, quill feathers of wings and tail white. The wings are useless for flight, but of some assistance in running that the bird can outstrip the best horse.

OSTRICH.

ostriches are polygamous, the hens lay their eggs in a common nest, a hole scratched in the sand, and the cock bird relieves the hens in the task of incubation, which is aided by the heat of the sun. [STODOLIC.]

1. *Ornith.*: A popular English name for any nocturnal raptorial bird, of which about 200 species are known. Their classification is in a very unsettled state. Willughby's division into two sections—one having "ears" or "horns," as the tufts of feathers on their heads were called, the other destitute of such appendages—was shown to be unnatural by Geoffrey St. Hillaire. They were formerly made a family of Accipitres, or Raptors, but are now more generally raised to an order (or at least a sub-order), Strigæ. Following Alphonse Milne-Edwards, a classification has been proposed, based on pterylogical and osteological characters, broadly dividing the Owls into two sections: (1) The Screech-owl, and (2) the Tawny-owl section, with (the Linnæan) *Strix flammea* and *S. stridula* as the respective types. The former is known as the Alucine (from Fleming's name for the genus, Aluco), and the latter as the Strigine section. The prevailing colour of the plumage is brown, with a tinge of rusty-red, and it is exceedingly hoarse and soft, so that their flight (even in the larger species) is almost noiseless, enabling them to swoop upon their prey, which they hunt in the twilight. All owls eat up in the form of pellets the indigestible parts of the food swallowed. These castings may be seen under any owl-roost, and show plainly the great service these birds render to man in destroying rats and mice. They range over the whole globe, extending to the extreme polar regions and to the remotest oceanic islands.

1. *Zoology*:
 (1) The castrated male of *Bos taurus* when arrived at maturity. [BULL, STEER.]

(2) The popular English name for the genus *Bos* (q.v.). It has been known from remote antiquity, and in the East possessed, and in India still possesses, a sacred character. They have been broadly divided into two groups — the humped, with *Bos indicus*, and the straight-backed, with *B. taurus* as a type. The domestic oxen of Britain consist of a great number of different breeds, the principal of which are described under their respective names; and there is a still larger number of Continental breeds. Their progenitors were probably: (1) *Bos primigenius* [URES]; (2) *B. longifrons*, probably domesticated by the aborigines of Britain from the Roman myson (*Ovis* a; *Brit. Foss. Mammals*, p. 124); and (3) *B. frontosus*, which Nilsson regards as the progenitor of the mountain

cattle of Norway. The English breeds may be conveniently grouped in three classes:— (1) Polled cattle; (2) Short horned cattle; and (3) Long horned cattle, usually white and red and occupying the more fertile parts of the country. The Hungarian oxen are noted for their great size and enormous horns. The Irishland cattle was introduced into Spain, and so became the progenitors of the herds of wild cattle which roam over the South American continent, the descendants of it is said of seven oxen and one bull brought from Andalusia to Paraguay in 1500. Oxen have been introduced into Australia and New Zealand, where their breeding them forms an important industry; and among the Caffres they are trained to watch the flocks, to guard them against attacks of wild animals, and even to take part in intertribal battles. The peculiar home of humped oxen is India, where they appear to have been domesticated at an early period, as similar forms occur on sculptures of remote antiquity. They are also found in Japan and in Africa. [ZOO, BIVHMAS-ETC.]

"It is impossible to over-estimate the services rendered by the ox to the human race. Having, if possible, its owner's hand and feet, his harrow, carries his loads or himself, moulds his property, and even helps his battles, with its adders, which under domestication have been commonly yoked to it, yield him at all seasons a copious supply of milk. When dead, its flesh forms a chief source of animal food; its bones are ground into manure, or turned into numerous articles of use or ornament. Its skin is made into leather, its ears and hoofs into glue; its hair is mixed with mortar; and its horns are cut and pointed into spoons and other useful articles." — *J. Gibbon*, in *Lowe's Brit.*, vol. 9th, p. 24.

independently, but the name was given by Lavoisier some time after. It can be obtained pure by heating black oxide of manganese, or a mixture of this oxide with potassic chlorate in a retort, and collecting the gas over water. When pure it is without colour, taste, or smell. It is the sustaining principle of animal life and of the ordinary phenomena of combustion. Phosphorus and ignited charcoal burn in it with great brilliancy, and a piece of watch-spring, having at the end some lighted sulphur, exhibits in oxygen a beautiful phenomenon of combustion. It is a little heavier than atmospheric air, sp. gr. = 1.1. One hundred cubic inches of oxygen at mean temperature and pressure weigh 34.29 grains. Under the influence of cold and high pressure it has been reduced to the liquid state. It enters into combination in various ways, taking the place of hydrogen in the radicals of compounds formed on any of the types, HCl, H₂O, H₂N, &c., giving rise to oxychlorides, oxyhydrides, oxynitrides, &c.

The words of the commission are, "To enquire, hear, and determine," so that by virtue of this commission they can only proceed upon an indictment found at the same assizes; for they must first inquire by means of the grand jury or inquest, before they are empowered to hear and determine by the help of the petty jury.—*Blackstone Comment.*, bk. ix., ch. 19.

 1. *Zool.:* The genus *Ostrea* (q.v.), and especially *Ostrea edulis*, of which there are two kinds—Sea Oysters, which arrive at maturity in about four years, and Natives, which are artificially cultivated, and do not reach their full growth for five and sometimes seven years. The latter are the more highly esteemed. The shell is thin, with a metallic ring, and an equilateral lustre on the inner side, the cavity in which the animal rests resembling an egg-cup. The flesh should be white and firm, and with a nutty flavour. The mouth of the Thames, bounded by a line connecting Walton and Margate, is the home of British Natives, and Whitstable the best fattening-ground for them, for they thrive best on London clay. A sandy bottom is fatal to oyster culture; for the grains get into the hinge, and prevent the opening and shutting of the valves of the shell. Their food consists of minute organisms. Oysters spawn in May or June, the "spit" resembling fine slate-pencil dust. The number of ova from one female has been variously estimated. Raster calculated it as high as 100,000. Læwenhoeck put it as high as

fate, fât, fâre, amidst, whât, fall, father: wê, wêt, hère, camêl, hêr, thêre: pîno, pît, sîre, sîr, marine: gô, pôl, or, wôrc, wolf, work, whô, sôn: mütc, eüb, cure, unite, eür, rülc, füll: try, Syrián. æ, œ = ê: ey = â: qu = kw.

10,000,000, but the most general estimate is about three-quarters of a million. The Starfish and Dog whelk are deadly enemies to the oyster, and cause great loss to the proprietors of oyster-fisheries. Oysters appear in the Carboniferous strata, and two related forms - *Gly. phœa* and *Exogyra* - with thick heavy shells, are common fossils. Oysters were known to and esteemed by the Romans. Juvénal (iv. 140-42) tells how Montanus could distinguish by the taste whether an oyster came

OYSTERS. A. From five to six months. B. From three to four months. C. From one month to two months. D. Twenty days after birth.

from Greece, the Lucerne Lake, or Rintupæ (the modern Richmond). It was then a common belief that oysters and other "shell-fish" grew fat or lost flesh as the moon waxed or waned (Cic., *de Div.*, ii. 33). They were also known to less cultured nations, as is proved by the existence of oyster-shells in the kitchen-middens of Europe and America. Thunberg is also given to some other molluscs, as Hammer-oyster, Pearl-oyster, &c. These will be found under their proper entries.

Orcyth.: *Hemotopus ostreolegus*; a handsome British bird, about sixteen inches long, most common on the flat, sandy coasts of Lincolnshire. The bill, about three inches long, is a rich ruddy colour, deepest at the base; very much compressed, with a wedge-like termination. Oyster-catcher is a misnomer, for the bird feeds mostly on mussels and limpets, though it frequently takes to the water in search of food. Sometimes called the Sea Pie. Mr. Harting informed Prof. Newton that "the bird seems to lay its head sideways on the ground, and then, grasping the limpet's shell close to the rock between the mandibles, use them as scissor-blades to cut off the mollusc from its sticking-place." pā-gan-īṣm, 'pa-gan-isme, s. [Eng. pagan; -ism.] The state or condition of a pagan; heathenism; the worship of idols or false gods.

"The ruin of paganism, in the age of Theodosius, is, perhaps, the only example of the total extinction of any ancient and popular superstition.—Gibbon, Roman Empire, ch. XXVIII.

• Used specially of that of ancient Rome. Licinius having made war against Constantine, A.D. 311, and again in 324, after the conversion of the latter to Christianity, was supported by the good wishes and the power of the pagan priests. Constantine believed that paganism was a danger to the throne, and began to discourage it. In 331 he ordered the destruction of the pagan temples throughout the Roman empire. Julian, in 361, began to rebuild them, but the work ceased with his death. In 385 Theodosius I. issued an edict against pagan sacrifices, and soon afterwards closed the temples and the shrines. In 388 the Roman Senate renounced paganism, and in 391 it was legally abolished through the whole Roman empire, and afterwards gradually died away.

1. The temple of an idol in India. They belong both to antiquity and modern times. Some are wonderfully large and magnificent. They consist of one or more quadrangular courts with towers at the corners, surrounded by a wall. Large pyramids rising in stages cover the entrance, behind which extend colonnades. Inside the courts are lustal pools, colonnades, and large halls, called Tsalutris, which are used to lodge pilgrims. Small side-temple appear with cupolas surmounting the egressory buildings. Behind the first court is often a second and a third, in which, finally, the chief temple stands. Although the architecture of all these constructive designs has no pretensions to artistic or poetic importance, still a wonderfully fantastic effect is produced by a tasteless excess in peculiar ornamentation and architectural features. The most important pagodas are those of Madura, Tanjore, and Chidambaram. The most celebrated is that of Angkorant, in the island of Ramisseram, completed towards the end of the twelfth century. All these buildings are of a pyramidal shape, with vertical stages, which are separated by curved roofs and terminate above in the form of a cupola. Rows of small cupolas stand out from the roofs of the stages.

palaecorystic sea, s.

Phys. Geog.: (See *EXTRACT*.)

"We had long been aware that the ice of which this part of the floor was composed consisted of late massive floes, not of a new season's formation, but the erosion of ages, real thickbered ice. Except along the west coasts of Banks and Finner Patrick Islands, no such ice had ever before been met with in the Arctic regions. It therefore became desirable to apply to it a special name by which it might be provisionally known. After some discussion, Captain Nares (1851) decided upon calling the region *ice*, on the southern border of which we were wintering, the '*Palaecorystic Sea*,' the name being derived from the two Greek words *παλαιος*, ancient, and *κρυσταλλος*, ice. This term was used for the great floe in polar sea during the remaining period of our detention on its borders." —*A. H. Michelson, Treatise on Fossil Fishes*, p. 25.

pāl æ-ô zô-ïc, *a.* [Pref. *palæo-*, and Gr. *ζωή* (*zôh*) = life, existence.]

Geol.: The term generally applied to the series of strata commencing with the first rocks which have traces of life, and ending with the upper part of the Permian. As the uppermost strata of all are called by some Quaternary, those immediately beneath these Tertiary, and those a stage further down Secondary, one would expect the basal rocks of the series to be called Primary. But unhappily that term was misused in the infancy of geology, being applied to granite, gneiss, &c., in consequence of which, to avoid confusion, it was allowed to become, for a time at least, extinct,—the word palaeozoic being substituted in its room. Sir Charles Lyell, however, in his *Student's Elements of Geology*, retained its use, dividing the "Primary or Palaeozoic," from beneath upwards into Laurentian or Archæan, Cambrian, Silurian, Devonian, Carboniferous, and Permian (q.v.). Judged by the thickness of the beds, the Palaeozoic strata took a vastly longer time to deposit than all the strata which succeeded, from the close of the Permian to the present time. The palaeontological break between the Palaeozoic and the Secondary rocks is very considerable. (For details see the various divisions of the period.) (*Geology*, Fossils.)

Palladian architecture, *s.* A style of architecture introduced by Palladio, and conforming closely to the precepts of Vitruvius. As regards style, it falls under the category of Roman Renaissance, but of rather a confused kind, to be adorned buildings of every kind, and of most varied purposes and arrangement, with classical temple-portals, without taking into consideration their object or the requirements of the building as a whole, so that the order was frequently carried up through several storeys without any reference to its arrangement. The lower storey of palaces built by Palladio, the greater part of which are at Vicenza, is generally of rustic work, whilst the upper storeys have pilasters or a colonnade; occasionally, however, pilasters or arcades are introduced on the ground-floor. The works of Palladio remained for a long period the model for an entire style.

I. Ordinary Language:
1. Lit.: In the same sense as *lib. 1*.
2. Fig.: That which affords defence, protection, or safety; a safeguard. "A *pal* of *palladine* to save the city." — *Milton*, *Rehearsal*, *in England*, *lib. 1*.
II. Technically:
1. Class. Antiq.: A celebrated statue of Pallas or Minerva, on the preservation of which depended the safety of the city of Troy. (Virg.: *Æneid*, *lib. ii. 166-182*.) This circumstance being known to the Greeks during the Trojan war, Ulysses and Diomedes, by the advice and aid of Helenus, son of Priam, climbed secretly by night over the ramparts of Troy, and carried it off.
2. Chem.: A tetrad metallic element discovered by Wollaston in 1802. Symbol, *Pl*; at wt. 106.6; sp. gr. 12.1. It is found, associated with platinum and gold, in South America, and is extracted from the gold in which it occurs by fusing with silver, dissolving out the palladium, &c., with nitric acid, removing silver with common salt, and then adding ammonia and hydrochloric acid, which throws down ammonia-chloride of palladium as a yellow powder. This, on ignition, yields the pure metal. It resembles platinum in its malleability and ductility, but is more fusible, less dense, and has a more silvery appearance. It is slightly soluble in concentrated hydrochloric and sulphuric acids, more so in nitric acid, but dissolves freely in nitro-hydrochloric acid. Its surface is blackened by tincture of iodine, which has no effect on platinum. Like platinum, it forms two classes of compounds, viz., palladium compounds, in which it is bivalent, and palladic compounds, in which it is quadrivalent.
3. Min.: An isomorphous native metal, not found pure, but mostly alloyed with a little platinum and iridium. Sometimes found in minute octahedrons, but mostly as grains, with native platinum, in Brazil. Hardness, 4.5-5; sp. gr. 11.5-11.8; lustre, metallic; colour, steel-gray.

"In all cases of a venereal character, as transmitted through two, three, or any more generations, and as then developed under certain unknown favourable conditions. These important distinctions between transmission and development will be best kept in mind by the hypothesis of panogenesis. According to this hypothesis every unit of cell in the body throws off gemmules, or undeveloped atoms, which are transmitted to the offspring, a body whose are made up of self-division. They may remain undeveloped during the early years of life, or during successive generations; and their development into units of cells, like those from which they were derived, depends on their affinity for, and union with other units or cells, previously developed in the line order of growth."

2. A painting of a complete scene, viewed from a central point, or made continuous upon an unrolling canvas, as if the spectator were passing the particular spots consecutively. The invention of the panorama is due to Barker, a portrait-painter of Edinburgh, who obtained a patent for his invention in 1787. Of late years, the verisimilitude of panoramas has been greatly increased. The spectators stand on a central platform, and the painting forms the boundary of a circular building, while the space from the platform to the painting is realistically treated. This has been done with great effect in panoramas of battle-scenes, the foreground being strewn with shattered arms, lay-figures of men and horses, and the juncture of the mass and the

panning so skillfully effected, that it is difficult to tell where one ends and the other begins.

Philos.: The view that God and the universe are identical. It was taught in India in the Vedantic system of philosophy, one of the six leading schools of thought, and to this day it is widely accepted, both by the instructed Brahmins and by the common people. Pantheism is believed to have been the creed of various Greek philosophers, as of Anaximander of Miletus (b.c. 610-547), Pythagoras (b.c. 610-547), and Xenophanes (540-500). It was held by John Scotus Erigena, A.D. 874. In the latter part of the twelfth century it was taught by Amalric of Chartres, a dialectician and theologian. Pope Innocent III. forced him to recant his views, notwithstanding which his bones were dug up and burnt in 1209. John, Bishop of Strasbourg, in a treatise against the Brethren of the Free Spirit, published in 137, attributed to them this, among other tenets, "God is formally whatever exists." By many Spinoza is considered to have revived Pantheism, but

his teaching in this respect has been misunderstood. [SPINOZISM.] In the Pantheism of Schelling God is considered as the Absolute Being, presiding Himself in external nature and in human intelligence and freedom, thus closely approaching the dictum of St. Paul, "In him we live, and move, and have our being" (Acts, xviii. 28; cf. Col. i. 17). It is noteworthy that the Greek poet (Aristos, *Phœnon*, 1-5) quoted by St. Paul is distinctly pantheistic, and his lines might have served for the germ of the better known, but not less beautiful passage in Virgil (*Georg.* iv. 219-227). [See example under Pantheist.]

pan thē ist, *s.* [Eng. *panthe(ism)*; *-ist*.] One who believes that God and the universe are identical.

The principle of the pantograph is all that could be desired in the way of perfection; but it is found in practice, on account of the numerous joints and the necessary imperfections in its mechanical construction, that it is far from being an accurate instrument. The pantograph is principally useful to the draughtsman in enabling him to mark off the principal points in a reduced copy, through which the lines may afterwards be drawn by the usual methods of construction. For this purpose it is found to work successfully.

II. Manuf.: A material made in thin sheets from a pulp of rags, esparto grass, straw, wood, and other fibres, and used for writing or printing upon, or for wrapping. The name is derived from papyrus, an Egyptian reed, whose stalk furnished the principal material for writing upon to the nations bordering upon the Mediterranean for so many centuries. [PAPYRUS.] Paper is manufactured principally from vegetable fibre, reduced to a pulp by boiling and mechanical means. Over 400 different materials have been suggested or actually used for paper manufacture, but rags and esparto form the best materials. Old written or printed paper is also extensively used for re-manufacture. The oldest manuscript written

on cotton paper in England is in the Bodleian collection of the British Museum, and bears date 1049. The most ancient manuscript on the same material in the Library of Paris is dated 1059. Up to the beginning of the nineteenth century, all paper was manufactured by hand, in moulds of various sizes. The different kinds of paper manufactured in the United Kingdom, for printing, drawing, correspondence, &c., will be found under their proper names. Machine-made paper is manufactured in a continuous sheet, and newspapers of large circulation are printed on webs several miles in length, the paper not being cut until after the printing. paper-money, s.

Comm.: Paper-money may be either with or without forced currency enacted by law in the country of its issue and circulation. In the former case, the holder has no right to claim coin in exchange, as the paper supersedes the coinage and common use of metallic money. In the latter case, it is simply a promise to pay coin, voluntarily accepted at the calculated current estimate of its fiduciary value. Of forced currency, otherwise called inconvertible paper-money, there have been abundant examples in the past century. France issued its *assignats* between 1789 and 1795, during which years they fluctuated between par, or an equal value with silver coin, and a depreciation of 99-100 per cent., thus utterly cancelling their value in exchange. England restricted its specie payments, wholly or partially, from 1797 to 1821, with a resulting fluctuation between an equal or par value of paper-money and gold coin and a depreciation of 25½ per cent. at the lowest point. The financial history of all other countries of Europe and America presents exactly similar examples down to the present time. In the case of paper-money without forced currency, such as bank-notes promising to pay, on demand, a given sum in coin, the chance of loss to holders is guarded against by the necessity, enforced by law or prudence, of keeping up such a reserve of coin as experience proves to be generally sufficient.

In Tahiti the bark is made into fine cloth; in China the juice is used as glue.

From the same source come *parable*, *parabola*, *parole* (old form of *parole*), *parole*, *palaver* (q.v.).]

1. A comparison, a similitude; specif. a fable or allegorical relation or representation of something real in life or nature, from which a moral is drawn for instruction. It differs from an apologue, in that it relates or represents things which, though fictitious, might happen in nature.

"Declare unto us the *parable* of the tares."—*Math.* xiii. 34.

2. An allegorical or mystical saying or expression; a proverb.

"Into them that are without all these things are done *in parables*."—*Mark* iv. 11.

¶ Both *parable* and *allegory* imply a veiled mode of speech, which serves more or less to conceal the main object of the discourse by presenting it under the appearance of something else, which accords with it in most of the particulars: the *parable* is mostly employed for moral purposes; the *allegory* in describing historical events. The *parable* substitutes some other subject or agent, who is represented under a character that is suitable to one referred to. In the *allegory* are introduced strange and arbitrary persons in the place of the real personages, or imaginary characteristics, and circumstances are ascribed to real persons.

pa rāb-ō-la, s. [Lat., from Gr. *παράβολή* (*parabōlē*), so called from its axis being parallel to the side of the cone; Ger. *parabel*; Fr. *parabole*; Ital. *parabola*.] [PARABLE, s.]

Math.: In conic sections, a plane curve of such a form, that if from any point in the curve one straight line be drawn to a given fixed point, the other perpendicular to a straight line given in position, these two straight lines will always be equal to one another. The given fixed point is called the focus of the parabola. The straight line given in position is called the directrix (q.v.). A

straight line drawn perpendicular to the directrix, and cutting the curve, is called a diameter, and the point in which it cuts the curve is called the vertex of the diameter. The diameter which passes through the focus is the axis, and the point in which it cuts the curve is the principal vertex. A straight line which meets the curve in any point, but which when produced both ways does not cut it, is called a tangent to the curve at that point. A straight line drawn from any point in the curve, parallel to the tangent at the vertex of any diameter, and terminated both ways by the curve, is called an ordinate to that diameter. The ordinate which passes through the focus is called the parameter of that diameter. The part of a diameter intercepted between its vertex and the point in which it is intersected by one of its own ordinates, is called the abscissa, or the part of the diameter of the diameter. A straight line drawn from any point in the curve, perpendicular to the axis, and terminated both ways by the curve, is called an ordinate to the axis. The ordinate to the axis which passes through the focus is called the principal parameter, or latus rectum, of the parabola. The part of the axis intercepted between its vertex and the point in which it is intersected

If a tangent be drawn at any point, and a straight line be drawn from the point of contact perpendicular to it and terminated by the axis, that straight line is called a normal. V. it is rendered "forest," and in Eccles. vi. 5, and Song of Solomon iv. 13, where it is rendered "orchard." The R.V. translates the first and second "park" and the third "garden," or, on the margin, "paradise." The word, which was of Aryan origin, specially referred to the tree-studded parks around Persian palaces, and the LXX. applied the word *παράδεισος* (*paradeisos*) to the Garden of Eden. [EDEN.] The word Paradise occurs three times in the A. V. of the New Testament. It was the place to which Jesus and the penitent "thief" (robber) went the day that they died (Luke xxiii. 43). St. Paul was caught up into it, and identified it with the third heaven (cf. 2 Cor. xii. 2, 4). With analogies still preserved to the earthly Eden, the tree of life is in its midst (cf. Rev. vi. 7 with Gen. ii. 9).

* Eden, where delicious Paradise Now nearer, crowns with her caucasic green, As with a rural noontide, the deep canopy head Of a steep wilderness. *Milton (P. L., l. v, 12)*

1. Astron.: The difference between the position of a heavenly body as viewed from a station on the earth's surface and as it would be if seen from the centre of our planet. It is measured by an angle, of which the point is formed by the heavenly body, whilst the straight lines enclosing it touch the observer's position and the centre of the earth. (Clerk: Pop. Astronomy, ed. 6th, p. 142.) The parallax of the sun is between 8" and 9", and that of the moon about a degree and a half. (Ibid., pp. 299, 310)

† 2. Optics: The difference in the position of an object produced when the wires are not at a proper distance from the object glass.

† (1) Angle of parallax:

Optics: The angle formed by two lines drawn from an object, one to the centre of each eye.

(2) Angle of parallax:

(a) The term sometimes applied to parallax, if any is visible, of a star when viewed from two opposite points of the earth's orbit. The annual parallax of the stars is not in any case certainly 2", and, in every case but one, unquestionably less than a single second.

(b) Sometimes the difference in the position of a star as viewed from the sun and from the earth at the extremity of her orbit, in other words, with a base line of half her orbit.

(c) Binocular parallax:

Optics: The difference between the position of an object as seen with the one eye and with the other, the head remaining unmoved.

(d) Cosmical parallax: The same as Diurnal parallax.

(e) Diurnal parallax: The same as Geocentric parallax (c.f.v.).

(f) Geocentric parallax:

Astron.: The parallax of a heavenly body when in the horizon. The term is specially used of the moon. When in the horizon the parallax is greater than when the moon is in any other position.

(g) Horizontal equatorial parallax:

Astron.: As the radii of the earth are not all equal, it is essential to decide which to use in calculating the moon's horizontal parallax. The insertion of the term equatorial means that the equator is the particular radius which has been employed, as it actually is by most astronomers. The moon's horizontal equatorial parallax varies from 54' to 1° 15', the difference arising from the elliptic orbit in which the luminary moves. (Clerk: Pop. Astronomy, p. 165.) The distance of the moon is computed by means of her equatorial horizontal parallax. Theoretically speaking, that of the sun can be ascertained in a similar way; but, the figures being small, a minute error in them would make a great difference in the results of computations founded on them. Hence other methods are adopted. (See TRANSMIT.)

(h) Parallax in altitude:

Astron.: The parallax of a heavenly body when it has risen to a certain altitude above the horizon.

[Dr. Buckland, Macculloch, Agassiz, Sir I. Dick Lundy, Mr. Darwin, Mr. Milne Holmes, Prof. J. Rogers, Sir John Chambers, Mr. Jamieson, Sir Charles Lyell, Rev. R. B. Watson, Lord Aylemer, Prof. Babinet, &c.] have all attempted to solve the problem of the roads. They were probably made by water, which, during the elevation of the land, stood for long periods at the three successive levels. Some contend that the water which produced them was that of a lake, perhaps a glacial lake, others that of the ocean. Lord Aylemer advocates the former view, and considers that the waves would throw the materials which they moved in a downward direction. [*Geol. Soc. Trans.*, IV, 314; *Quart. Journ. Geol. pa-rām-ō-tēr, s. [Pref. *para-*, and Eng. *inter*.]

Math.: A name given to a constant quantity entering into the equation of a curve. The term is principally used in discussing the conic sections. In the parabola the parameter of any diameter is a third proportional to the abscissa and ordinate of any point of the curve, the abscissa and ordinate being referred to that diameter and the tangent at its vertex. In all cases the parameter of any diameter is equal to four times the distance from the focus to the vertex of the diameter. The parameter of the axis is the least possible, and is called the parameter of the curve. In the ellipse and hyperbola, the parameter of any diameter is a third proportional to the diameter and its conjugate. The parameter of the transverse axis is the least possible, and is called the parameter of the curve. In all of the conic sections, the parameter of the curve is equal to the chord of the curve drawn through the focus, perpendicular to the axis. The parameter of a conic section and the foci are sufficient data for constructing the curve.

I. Ordinary Language :

1. One who frequents the tables of the rich, eating his welcome by flattery; a trencher friend; a hanger-on, a man in and fawning flatterer; a sycophant.

"Live both a and long." - Most staid, smooth, doctored parasites." - Shakspeare: Troilus & Cressida, in 4.

2. An animal or plant subsisting at the expense of another organism.

II. Technically :

1. Bot. : The parasites on plants are either animals or vegetables. Some of the latter are of high organization, as Lemnoids and Orphanche among Exogens, and Epiphytic Orchids among Endogens. Many cryptogams in certain ferns, mosses, lichens, and fungi are parasites. The roots of the more highly organized parasites penetrate the substance of the herb, at whose expense they feed, and take up from it nutrient substances already in large measure assimilated. The lower parasites, by means of their cells, penetrate other cells to live in and on them. The former are more destructive to the plant.

2. Min. : A plumose variety of boracite (q.v.) occurring in the interior of crystals of the same, and resulting from their partial alteration.

3. Zool. : An animal which lives in, on, or at the expense of the actual substance of another. There is scarcely any animal which does not play the part of host to numerous parasites, and a very large number of the lower Invertebrata are parasitic at some stage of their existence. Parasites may enter the system in the following ways :

(1) Through the medium of food or drink. (2) Eggs are transferred from one animal to another by actual bodily contact, e.g., the eggs of Pentastemon by the beak of bees.

(3) Eggs are deposited in or on the host, as is the case with those of the Estridae.

Van Beneden divided Parasites into three classes. (1) Parasites proper, living at the expense of the organic substance of the hosts, as the tapeworm; (2) Commensals, who live with, or on, but not at the expense of their hosts, as sea anemones, often live on shells of bivalve shells, and come in for a share of their prey; and (3) Mutualists, a class not clearly defined, and now generally abandoned. Leuckhart divided Parasites into Ecto- and Endo-parasites, according as they lived on, or within, their hosts. Of the latter, by far the larger number belong to the type Vermes. Vertebrate parasites are rare, but exist among the Pisces. Myxine (the Hag-fish or Bore) penetrates the abdominal cavity of Gadoids, and feeds on their flesh; the species of Pteraster, Echinellus, and Echinus, and some Silirods, are commensals rather than true parasites.

"The special parasites of man are estimated by Colbold at as many as 121 species: 113 Trematodes, 10 Cestodes, 21 Nematodes, 17 Annelids, 17 Arachnids, 4 Insects; many of these, especially among insects."

"I have occurred only very rarely, and should not be reckoned; while a considerable number of the true parasitic forms have been only once or twice described. - He also estimates this becoming reduced well nice to half. - Emge, Brit. (ed. 30th), xvii. 200.

• The origin of parishes is lost in antiquity, some believe they were of civil, but the majority that they were of ecclesiastical origin. Christianity established itself first at the leading centres of populations, whence it put forth missionary efforts in every direction. Many subordinate churches in each place thus arose around the mother church, and tended slowly to become more independent, having assigned to them a district within which to operate, after which financial endowments would follow. Many lords of manors built and endowed churches for their dependents, and to this day manors and parishes are in many places coterminous. In the early ages a parish was a bishop's as distinguished from an archbishop's see, but when the former was gradually parcelled out into smaller portions these latter began to be called parishes. Camden says that England was divided into parishes by Honorius, the second Archbishop of Canterbury (c. 630), but Selden has shown that long after this the clergy lived in common, and were not separately located in parishes. Bede, about A.D. 700, mentions the lay foundation of parishes, and they are alluded to in the laws of King Edgar (A.D. 970). Mr. Topley, F.G.S. (*loc. cit.*) gives topographical reasons for believing

"That whatever may have been the origin of manors or parishes as such, they both depend upon still older divisions of the land, and that these were not formed by the arbitrary act of church or king, but resulted necessarily from the great physical features of the country." *Brit. Assoc. Rep.* (1872), p. 197.

By the time of Pope Nicholas's taxation (A.D. 1288) the country parishes were settled as they remained till the Reformation. In

1520 there were 9,607, in 1831 those in England were 10,700, and in Scotland 948; and in 1903 in England about 15,000. In the Roman Church in England there are, properly speaking, no parishes. [MISSIONARY-DISTRICT.]

A parish is not merely an ecclesiastical division, it constitutes also an area for local government in matters civil, and is the smallest unit recognized for that purpose. For its officers, see Parish-officers. Of those who oversee impose rates for the relief of the poor, for maintaining the roads, the police, for sanitary purposes, &c. In some cases the parish is self-governed for certain of these purposes, but more generally it forms part of a union (q.v.). [QUOD VARIATA.]

par lia mēnt, 'par la ment, 'par lement, 'parlyament, s. [Fr. parlement - as speaking, a parleying, a supreme court, from parler = to speak; Low Lat. parliamentum, Sp., Port., & Ital. parlamento.]

1. A conference, a discussion. "First they held her parliament at." Rowland of the Tower.

2. In the same sense as II. 1. "A parliament, so principled, will seek." All ancient schools of enquiry in disgrace. Young, The Public Affairs.

4. In France before the Revolution of 1789, one of several judicial courts of the country.

5. Gingerbread in small thin hard cakes. "Grisp parlements with hollywags." - A. H. Smith, Recolled Addresses.

II. Technically:

1. Hist.: Blackstone says that the first use of the French word parliament, to signify a General Assembly of the State, was under Louis VII. of France about the middle of the twelfth century. With this view Littré essentially agrees.

(1) The English Parliament. (2) The Imperial Parliament: The legislature of the United Kingdom of Great Britain and Ireland, consisting of the Sovereign and the Houses of Lords and Commons. It arose long prior to the union of the kingdoms as the English Parliament. The first use of the word parliament in the statutes of England is in the preamble to the Statute of Westminster, A.D. 1272. The germ of the institution existed, however, long before the name arose. Each of the kingdoms of the Saxon heptarchy, or octarchy, seems to have had its witenagemote, or meeting of wise men, which, on the union of the several kingdoms, became united into one great assembly or council. In Edward the Confessor's law de Wifotha, a tenth is confirmed to the Church by the king, the barons, and the people. The laws and charters of the early Norman kings mention only abbots, barons, &c. In 1176 there was a council of bishops, earls, barons, knights, and men. Writs A.D. 1266 are still extant summoning knights, citizens, and burghesses to Parliament. The statute 2 Edward II. (1322) recognises Parliament as having for some time existed, and with a constitution essentially the same as now. The powers of Parliament are very great. Not merely can it destroy any ministry, it can alter, and has in fact altered, the succession to the throne. At the Reformation it transferred property enjoyed by the Church of Rome and altered the national religion, endowing Protestantism with money given for Roman Catholic purposes. Parliament is called together by the sovereign, who appoints the time and place of meeting, and opens the proceedings by the delivery of a speech, either personally or by deputy. Each house can adjourn, but neither can be prorogued except by the sovereign. Each judges of its own privileges. Members of both houses are free from arrest or imprisonment on civil actions, but their property can be seized for debt. No quorum is needed for the transaction of business in the Upper House; forty is the quorum in the Lower. [FRANCISE-BILL, COMMONS, LORDS, REFORM.]

(3) French Parliament: A parliament arising about 987. It met at different places. In 1190 Philip Augustus instituted the Parliament of Paris. In 1302 it was divided into three chambers. It was suppressed in 1771, revived in 1774, demanded a meeting of the States-General in 1787, and was superseded by the National Assembly Nov. 3, 1789. A French parliament still exists, but not the name.

(4) Irish Parliament: A parliament held in Ireland when it was an independent country. In 1295 writs for knights of the shires were issued. It met for the last time on Aug. 2, 1800, the union with Great Britain having terminated its existence. [PARLIAMENTS.]

(5) Scottish Parliament: A parliament held in Scotland when it was an independent country. It has been traced back to a council held at Seone under the auspices of John Balliol, in 1292. There was but a single house, consisting of lords temporal and spiritual, occasionally with burghesses. Having passed the Act of Union with England on Jan. 16, 1707, its last meeting took place on April 22 of that year.

Ichthy.: The popular name of what was formerly believed to be a distinct salmonid species, *Salmo salaudus*, common in British rivers.

"Shaw has demonstrated in the most conclusive manner, that those small salmonids, which are generally called *Parr*, are the offspring of the salmon, and that in our waters, from seven to eight inches long, have their sexual organs fully developed, and that their milk has all the impregnating properties of the seminal fluid of a much older and larger fish. That this *Parr* is not a distinct species—as has been again maintained by Gutch—is further proved by the circumstance that these exactly mature *Parr* are absolutely identical in their zoological characters with the immature *Parr*, which are undoubtedly young salmon, and that as *Parr* has ever been found with mature ova.—Guther, *Study of Fishes*, p. 629.

Ornith.: The typical genus of Parrina (q.v.). [ACANA.]

pār-ra-keēt, **pār-ā-keēt**, s. [Fr. *parraquet*.]

Ornith.: A popular name for any of the smaller long-tailed parrots. The word is in common use, but is applied without any strict scientific limitation to birds of different genera, and even of different families. Generally speaking, any old-world parrot with a moderate bill, long and more or less graduated tail, with the ends of the feathers narrowed, and high and slender tarsus, is called a parakeet. The Crested Parakeet, or Parakeet Cuckoo, is *Nymphicus nova-hollandiæ*; the genus *Platyseris* contains the Wide-tailed Parakeets, and *Platycercus cabulensis* and *P. vitiensis* are known respectively as the Yellow-bellied, and the Rose or Nonpareil Parakeet, sometimes called the Rosella Parrot. *Prioniturus forbesii* is the Ground Parakeet, and Grass Parakeet is a popular name for the Australian genus *Melopsittacus*. *Fulvouscops torquatus*, the Rose-angled Parakeet, is a familiar cage-bird, as is the Alexandrine Parakeet (*Platycercus alexandrinæ*), so named from the supposition that it was brought to Europe by Alexander the Great. It was well known to the Greeks and Romans, and Ovid has described it in one of his daintiest Elegies (Im. ii, 6).

"Parakeet" itself in various ways in English is usually applied to the smaller kinds of Parrots; especially those which have long tails, not as *parakeet* in French which is used as a general term for all Parrots.—Eucye, *Bird*, vol. 9th, xviii, 323.

II. *Parrot*. (Fr. *parrot*.) The popular name for any individual of a well-known group of birds from the warmer regions of the globe, recognizable by the brilliant, and in some cases 20000, coloration of their plumage, and the facility with which many of them, not only the genera *Ceryle*, *Falcones*, and *Psittacines*, acquire a set of repeat words and phrases.

The most remarkable instances, see H. F. L. *Parrot*; M. J. *Parrot*; J. *Parrot*, *Parrot*. The best known mention of parrots occurs in Ctesias, a Greek historian of the fifth century B.C., who describes a bird which he calls *Barraco* (*Parrot*), concerning which Pliny, *Natural History*, B. 10, ch. 9th, xviii, c. 20 says: "There cannot be much talk in it, although that he had before him a male example of what is now commonly known as the Blossom-head Parakeet, and to which he assigns as *Parrotus caprea phala*, an inhabitant of many parts of India."

The classification of the Parrots is unsettled, and will be dealt with under *Psittacine*, which division has been made an order, a sub-order, and a family by different taxonomists. Many parrots are familiar cage birds in England; but probably the best known is the African Grey Parrot (*Psittacus erithacus*), of simple glossy gray plumage with a red tail. It accommodates itself readily to captivity, and attains a great age. The Parrots embrace a number of widely divergent forms, from the grossly plumbed macaws to the soberly clad owl-parrot, and they differ not less in their habits than in their outward appearance; for while the majority are fruit-eaters, some are honey-eaters, and one species is said, on the authority of Dr. Buller (*Birds of New Zealand*), to be carnivorous. [Cockatoo, Macaw, Parakeet.]

The almost universal distribution of Parrots wherever the climate is sufficiently mild or uniform to furnish them with a perennial supply of food, no less than their varied details of organization, combined with a great uniformity of general type, fit them in an unmistakable language, of a very remote antiquity. [Wallace *Long Island*, p. 100.]

Music: A vocal composition, having a striking melody harmonized by other parts more or less freely, but from which counterpoint is for the most part excluded. *2. In the same sense as II.

II. Gram.: A part of speech, so called because it partakes of the nature both of a verb and an adjective. A participle differs from an adjective in that it implies the relation of time, and therefore is applied to a specific act, while the adjective denotes only an attribute as a quality or characteristic without regard to time. Thus, in I have written a letter, written is a participle denoting a specific act done at a certain time; but in a written letter, written is an adjective. There are two simple participles in English, the present (or imperfect active) and the past (or passive). The former now ends in -ing, the latter in -ed, -d, or -t, in the case of weak verbs; in the case of strong verbs the past participles all once ended in -en or -n, as in Love, known, sew, sown, but in very many cases this suffix has been dropped, in many other instances verbs originally strong have adopted a weak form for the past tense and past participle, as in sweep, swept (orig. swēpan, swēpen), even, creased (orig. crēwan, crēwan), &c. In such sentences as sewing is believing, the termination -ing is not that of the present participle, but represents the A.S. verbal termination -ant, as in shouting = A.S. scrowung.

 the prosecution of any business or under-
 taking, upon the understanding that the
 profits or losses shall be divided between them
 in proportion to the amount of capital, stock,
 labour, &c., supplied by each partner. If the
 number of partners exceeds ten when the
 partnership is entered into for banking pur-
 poses, or twenty when entered into for other
 purposes, the partnership must be registered
 under the Companies Act, 1862. A partner-
 ship may be limited to one venture or to one
 branch of business without including any
 other ventures or branches of business entered
 into by any of the partners. A partnership
 may be entered into for a definite time or a
 specific transaction, or may be left indefinite
 to be dissolved by mutual agreement between
 the partners. Partners are known as active
 or ostensible when they take an active part in
 the conduct of the business as principals; as
 dormant or sleeping when they do not take
 any active part, but are merely passive in the
 firm; and as nominal, when they allow their
 names to be used, and so are held out to the
 world as partners, although having no actual
 interest in the conduct of the business or its
 profits. Under Scots law, a partnership is a
 distinct personage, so that in actions brought
 by or against it the names of the individual
 partners need not be given. One partner can
 also bring an action against the firm as a
 distinct person, and the partnership can be
 made bankrupt without the goods of any of
 the partners being sequestered.

Passion-flower, s. *Bot.*: The genus *Passiflora* (q.v.). The three stigmas seemed to the devout Roman Catholics of South America to represent nails: one transfixing each hand, and one the feet of the Crucified Saviour; the five anthers, His five wounds; the rays of the corona, His crown of thorns, or the halo of glory around His head; the digitate leaves the hands of those who scourged him; the tendrils, the scourge itself; whilst, finally, the ten parts of the perianth were the ten apostles—that is, the twelve, wanting Judas who betrayed, and Peter who denied, his Lord.

Passion-music, s. Music set to the narrative of our Lord's Passion in the Gospels. Dramatic representations of the subject date from a very early period, there being still extant a play ascribed, though somewhat doubtfully, to Gregory Nazianzen, Bishop of Antioch. The dramatic performance of the Passion arose in imitation of the ancient custom, still observed in the Roman Church, of dividing the recital of the Gospel of the Passion in Holy Week between two, three, or more readers, assigning those parts which reproduce the words of the people (*chora*) to the congregation or choir. To one priest was assigned the part of Jesus; to others those of Pilate, Judas, &c. All these parts were recited according to the rules of the *ecclesiastics*, while the people's part was delivered in monotone. Some of the best known settings are by Bach.

pass-mént, s. [PASSEMENT.]

pass-ô-vèr, s. [Eng. *pass*, v., and *over*.] [PASSCH.]

1. *Judaism*:

(1) A festival instituted to commemorate Jehovah's "passing over" the Israelite houses while "passing through" those of the Egyptians, to destroy in the latter all the first-born (Exod. xii. 11, 12, 23, 27). The first passover (that in Egypt), those subsequently occurring in Old Testament times, and those of the New Testament and later Judaism, were all somewhat different. In the first of these a lamb without blemish was taken on the tenth, and killed on the fourteenth, of the month Abib, thenceforward in consequence to be reckoned the first month of the ecclesiastical year. The blood of the lamb was to be sprinkled on the two side-posts and the single upper door-post, and the flesh eaten "with unleavened bread and bitter herbs" before morning (Exod. xii. 1-13). That night Jehovah, passing over the blood-stained doors, slew the first-born in the Egyptian houses not similarly protected; and, as the unenraptured Jews that night departed from Egypt, that first passover could have continued only one day. But the festival was to be an annual one. Connected with it was to be a feast of unleavened bread, containing seven additional days, viz., from the fifteenth to the twenty-first of Abib, during which no leaven was to be eaten, or even allowed to be in the house (Exod. xii. 14-20; Num. xxviii. 16). [UNLEAVENED.] Sometimes the term *passover* is limited to the festival of the fourteenth of Abib; sometimes it includes that and the feast of unleavened bread also, the two being viewed as parts of one whole (Ezek. xli. 21). When the Jews reached Canaan, every male was required to present himself before God three a year, viz., at the passover, or feast of unleavened bread, at that of "harvest" and that of "ingathering" (Exod. xxiii. 16). The designations of the second and third suggest that the first also marked a stage in the agricultural year. It was, in fact, the spring festival (Deut. xvi. 9), held about the time when the first barley was ripe. In the Old Testament six passovers are mentioned as having been actually kept, that in Egypt (Exod. xii. 21-28), that in the wilderness (Num. ix. 1-14), that under Joshua's ritual (Joshua x. 10), that under Hezekiah's (2 Chron. xxx.), that under Josiah's (2 Chron. xxxv. 1), and that under Ezra's (Ezra vi.). After the exile wine was introduced, and is still used (cf.

M. P. XXX. 17, 27, A.C. In modern Judaism the Passover is celebrated, but the shank bone of a lamb of that animal is eaten, heaven put away and other ceremonies observed.

(2) The paschal lamb (Ezod. xii. 11; 2 Chron. xxx. 18; John viii. 28).

2. *As a verb*: Using passover in the sense of the paschal lamb, St. Paul applies the term to Christ, of whose death that of the paschal lamb was a type (1 Cor. v. 7; cf. John xix. 14). [PASTER.]
